Don't you think, that after five years, it is time you started doing ti
right?

Please go read *any* netiquette guide you want to choose, because
you'll find they all say that top posting is not appropriate.

>That way you [YOU] don't have to read through many lines you've read
>before. My comments are right there for a quick read/scan/delete.

Right there... and *totally* unconnected to whatever part of the original
article you are referring to, thus making everything you say somewhat
ambiguous. The fact is, if you trim out the quoted text that you are
not referring to, and place your response immediately below the referenced
text, 1) nobody has to read through "many lines you've read before", 2)
your comment is not ambiguous, and most of all 3) three or four articles
later if your comment is still pertinent to comments being made the
attributions and the added comments will all line up nicely to make it
obvious not only what was said, but when and by whom.

It is to some degree a matter of style... *effective style*.

If you completed with him you have the ability to pull his personal
contact information. as you have already been told go to
http://cgi3.ebay.com/aw-cgi/eBayISAPI.dll?MemberSearchShow and fill
out the form, get his address and phone. If those are not correct
notify ebay and they will remove him. If they are correct call hima nd
work out the issue. Seems your the only one who has had problems with
him.

How about giving us YOUR ebay id. Coal-76 seems to have an execlent
record. Whats yours? Looking at what he sells it small dollar items,
many home made ham radio/swl antennas. What auction was yours?

hey eric
the T90 does NOT use the CIV control like the other Icom radios actually
none of the HTs use the CIV they use a differnt cable to program the
radio the CIV is used to control the radio not program it
as for getting the radio into that mode its called clone mode and with
the radio off you plug the proper interface cable into the mic jack the
larger jack anyways then when you turn the radio back on it will
automatically go into clone mode
do a web search for RT systems they sell software and cable to program
that HT

The problem is: It takes a little effort to *think* about how to present an argument, how to reply to something and have a coherent train of thought in writing. It takes an effort to trim lines, to read over one's article.

Today's world is not about effort, it's about reward.

Spending time to *think* how other may want to follow an argument is not rewarding.

Say "Thank you" to Mickeysoft. The are the masters of HTML, top-posting, undeclared character sets, horrible quoting and a *HUGE* Send-Button.

Well, CI-V is a protocol, and AFAIK it's used to do both. The cables
for different rigs are different, I know, but this isn't the issue.
And the T90A certainly _sends_ CI-V commands while in clone mode, so
it does use that protocol. By the way, in clone it's using address
0xEE, so I think I answered one of my questions already.

>as for getting the radio into that mode its called clone mode and with
>the radio off you plug the proper interface cable into the mic jack the

You mean the speaker jack.

>larger jack anyways then when you turn the radio back on it will
>automatically go into clone mode

No, one has to press a key combination for that. My question was
whether there is a similar key combination for programming mode.

>do a web search for RT systems they sell software and cable to program
>that HT

The reason I originally asked is that I want to do it on my own.
Thanks for the reply.

HTX-245 2M/70cM were 230, now [if you can find them] about 100.00.

13.8VDC/25A switching P.S. were 119.95; now 60.00 again, IF you can find them.

Dual-band On-Glass antennas - were 39.95; now 19.95 IF you can find them.

Do you think R-S is getting out of dual band business?

If so, wait for the HTX-420 to drop from 270 to 135. 4-aa pack gives 3W/2W; recharge pack gives 4.2/3.2 while 13.8VDC gives 5/4. 2M section rcvs 138 - 174. SMART WX info on local xmttr; compass bearings in 5-dgree increments and cardinal points and 100 memories. I'm waiting for them to drop and will buy all I can find.

Since having van broken into and all gear except antennas ripped off, I've gone to HTX-245 2M/440 mini-HT to scan/listen to all local repeaters and public service freqs. and for trips. Velcro-ed to dash with Radio Shack powered external speaker underneath and I use a B&W AT-200 antenna matcher (switchable 2M/radio) which parallels HT with AM/FM radio to right front fender whip antenna. I modded the switch unit to sense RF and relay the contact points from stereo to xmitter. Adjustable to 1.2:1 with 50 watt capacity should I wish to use mobile rig again..

Ah, but a milliwatter still has a fairly sensitive front end. After my van was broken into and everything taken 'cept uniforms, I've gone to HTX-245 2M/440 as monitor using Barker & Williamson AT-200 match box for cowl mount AM/FM whip. I modded unit for relay to switch AM/FM to xceiver if I pick up signal can use either the 1.5W on 245 or go to HTX-420 with its 4.2W on rubber "dummy load" duckie.

Bill,

I've removed them with a single-edge razor blade mounted in a ~8"
handle. Auto shops sell them as "Inspection Sticker" removers. Let the
car sit in the sun for awhile to heat the adhesive, then scrape under
the adhesive while pulling the mount away from the glass. No promises,
your mileage may vary, etc.,.

Sure, Per Dave Stewart (and I hope he doesn't mind):

Hi John, the correct way to replace the battery is:

1.remove the upper and lower covers

2.place radio on bench, speaker in up position.

3.remove the screws (2) on the top left and right side of the face panel.

4.Loosen, do not remove, the lower left and right screws on the side of the face panel.

5. carefully rotate the front panel down to access the battery.

Re assemble radio, perform reset and you are finished.

You can also go www.mods.dk and look up the procedure.

4087. ARES/RACES vest?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-02 21:02:48 UTC
From: Ken <cprstn54zz@att.net>
Message-ID: <fmm5bvgq3i0ob1ruuq15avoo8qpdcg2ena@4ax.com>
Source record: 30968

I have found a commercial vest for use during ARES/RACES and community service events that I like a whole lot more than the one offered by ARRL.

See the first vest at:
http://home.att.net/~cprstn54/vestall.JPG

The one provided by ARRL for around $10 is at:
https://www.barkerspecialty.com/arrl/default.asp?action=showme&showme=ARES02&custid=ARRL010376&referid=303095209-522003-17012&vdate=522003

The one I am proposing can be ordered in royal blue with "AMATEUR RADIO" on the lime-green reflective panel. Royal blue is the color of the ARRL windbreaker.

Options include an HT pocket and a pencil pocket.

The second vest shows the royal blue color. The third vest shows how natty it looks in a good photo.

It costs around $55 for a single order. I am hoping to get the price down to around $35 if we order in quantity.

The vendor is at:
http://www.commandpostusa.com/storefront/vests.asp

Is anyone else interested at this lower price and would like to participate in a group order?

Need replacement cables for older HP test equipment, checkout our website:
http://www.glkinst.com/cables/hp_cables.htm

We offer many replacement cables for the HP 141T spectrum analyzer system, including tracking generators, tracking filters, extender cables, storage normalizers, etc. Many cables will work with the 8505A network analyzer too. Also, RF and I/O interconnect cables are available for the 8566, 8567, and 8568 A/B spectrum analyzers. Part numbers 85662-60093 and 85662-60094. The list of cables for the 141T system include:

HP 8443A/B, 100 KHz to 110 MHz Tracking Generator to 141T/8553B Display Aux. A, P/N 08443-60009

HP 8444A, 500 KHz to 1250 MHz Tracking Generator to 141T/8555A Display Aux. A , P/N 08444-60017

HP 8445B, 1.8 GHz to 18 GHz Tracking Filter to 141T/8555A Display Aux. B, P/N 08445-60007

HP 50 Ohm Termination for 141T/8553B/8555A Aux. A, P/N 08553-60122

Extender Service Cable for RF to IF Plugin, P/N 11592-60016
Extender Service Cable for 140/141 Display to RF/IF Plugin Units, P/N 11592-60015

HP 8501A, Storage Normalizer to HP 8505A Network, P/N 08501-60067

HP 8750A, Storage Normalizer, P/N 08750-60034
P/N 08750-60035 option 001 w/BNCs

Details can be found on our website at:
http://www.glkinst.com/cables/hp_cables.htm

Tomorrow, I plan to attend my first swap meet. I am looking for a mobile 2 meter or 2/440 radio at the, ahem, lower end of spectrum. Talking on my handheld isn't getting it.

What are good choices with realistic prices for something at this end of the price line? I'd really like to buy a radio but don't want to buy something that I will regret.

Thanks,

Wes

Better take some nose plugs. Hams are the most unbathed individules I
have been around. You will see what I mean. I would stay at home and
get something on ebay. Hams are disgusting!

Icom IC-471A UHF Allmode Base station transceiver. This is in very good condition, covers 430-450 Mhz, SSB, AM, FM, CW, built in tone, great for satellite work or just good UHF communications, 25 watts out, original manual, mike, and power cord, $300.

Generally speaking, Pete is correct. One caveat when using as an amateur receiver. Typically the mil-spec receivers have less than optimal filters for the busy amateur bands. A 3.24 or 3.1 ssb filter is not too handy on the amateur bands as crowded as they are these days. These receivers were meant to be operated on military/government frequencies where you can use wide filters and not be hammered from frequencies above and below you. If the filters are wider than 2.4 for ssb and replacements are expensive, I would pass.

Just my 2 cents.

Les

<< Common problem, resolder R121 on control unit A/2.
>>

Clif-

I started with the TM-942. A good sharp screwdriver was required for the screws holding the band modules to the front frame. As it turned out, the modules disconnected from the front frame without disassembling them, so I can worry about the other stripped screw heads later.

The only R121 I could find on the diagram appeared to have insufficient solder at one end and not much more at the other. I was worried about tin-lead solder ruining the surface-mount resistor, but found some lead-free solder at Radio Shack.

The operation appears to have been a success. As soon as I attached the TM-742 to the power supply and pressed the mike button, it drew current and the lights dimmed. So far, so good! I now have a bunch of channels to reprogram.

Thanks for your advice. It must have been very frustrating figuring that one out the first time.

Thank you for using FA:

Why not tell the truth. It CAN NOT BE HAD FOR $175.

If you were honest in your post you'd say $200 which is what one has to bid to walk away with it and not go through the auction process.

You see, we aren't as stupid as we seem here.

You can't be serious, right? This is a joke? Where is the technical part of the question?

A third (.3 or 1/3) of a watt (1000 milliwatts) is 300 milliwatts. You should have learned this before you were ever allowed to key a mic or handle an HT. If you were so inclined, you could have found this out in any number of ways yourself, without asking it in this forum and making a fool of yourself and laughingstocks of every no-code Technician in the world.

If I seem to a jerk, I apologize, but I am very sad for our hobby. Especially when someone with an amateur callsign catagorizes this as a technical question.

I know that when I took my tests, a knowledge of electronics (including mathematics) was a requisite. It would be difficult for someone to pass anything more than a Novice test without knowing the relationships between W, mW, V, mV etc.. along with a working knowledge of Ohm's Law, which requires the former..

His point is well taken; there is no relationship between the
question and some arbitrary level of previous test results.

Some people are very handy with the technical concepts necessary
to see that question as absolutely trivial, and some are not.
People who use that type of information daily would be
very comfortable with it, but others might not or might be
relatively new to dealing with such concepts and might be
less than confident about it. There is no need to insult
someone with ridicule.

Conversion between dBm and watts may look so easy that, since
you do it all the time, it is inconceivable that anyone couldn't
do it. All it takes is multiplication, right? But I'm willing
to bet that I can confuse 9 out of 10 people who can handle that
question by giving a detailed explanation of what "Test Level
Point" and the term "dBm0" means and how it is used. And all
that requires is the ability to do addition!

It just happens that TLP and dBm0 conversions are commonly used
in the telephone industry, but not elsewhere, and many people
who aren't familiar with it have to think about it for a couple
days to be comfortable. It isn't difficult, just different.

Gee, you mean all hams aren't electronic experts with degrees in Math? I get the impression from some people that in order to be part of this hobby, you have to hold a degree from one of the top schools in the country and if you don't know the answer to something that they do, you're nothing. Thank goodness the other hams in my area have more sense than that and can tollerate someone with a high school education and a little college.

Actually, no knowledge is required to obtain a ham license, only memorization
of the correct questions and answers without any real understanding of what you
are reading since the question pools are freely available on the internet.The
only part you actually have to learn something for is the CW test.

Starting bid is $175.
What happens if only one person bids on it? Guess what, that bidder
gets it for $175.
you not being stupid or stupid has nothing to do with it.

You might be able to pick up a nice dual band mobile radio
from anywhere from $125- $200 or so depending on how old it is.
You can get a good deal. When you buy one, ask the seller for his
callsign.
Most will give it to you assuring that nothing is wrong with the radio.
If there is he can be contacted. Also, at most hamfests there is a guy
that
has a "tune up clinic". He is not there to fix anything but will test
out radios
making sure they work OK before you buy.

OH, by the way, ignore the idiot with the important information who says
all hams smell.
99% do not.

Good luck in whatever rig you get!!

73, Mark

Any one who has completed middle school should be able to convert watts to milliwatts regardless of license class. It is a sad comment on the state of our schools that they cannot do so.

What you have heard is true.
The ITU CW requirement is; spending or recieving CW at the rate of no less than 3 WPM.
For phone priviledges on bands 30 MHz and below.
It is likely that the ITU memebrs (which the USA is one). will vote to remove this requirement during the next meeting.
The CW requirements the each member country chooses is their option.
The US military recently removed CW as a requirement. However, US special forces still teach and use it for covert ops.
Next, the ARRL will need to make "ham radios" wishes known to the FCC, the FCC will likely make the desired changes after that.
Write the ARRL and make your opinion heard. The most numeruos and vocal majority will likely get the changes they want.

Don't read between the lines of this message, I'm not coming down on either side of this issue.
Whatever the "majority" decides, is what I'll go with.

Hello People....Does anyone have any really solid information as to what is happening with dropping the code Proficiency test to be able to operate on all the HF Bands in a phone mode!! From the input I received so far it would appear that after this ITU meeting takes place...most all the countries will be in agreement for dropping the cw portion of the Licenseing exam...to be able to operate the High Frequencies via a phone mode.....If I'm not mistaken...I think this meeting is coming up, sometime this summer???

Any and all info that has some solidary to it would be greatly appreciated....

Thanks a Lot

>
>Regards Max

It's not the same. When you memorize the question pool, you know that a certian number of those questions that you memorized are on the test. When you learn CW, you are not memorizing the exact messages being sent on the test, you are learning CW and when the dits and dahs are sent on the test, you have no idea what they are going to be, unlike the written test.

Yup, but with my schedule, it's tough to find time to learn the code. I was actually sitting at the kitchen table this morning listening to a morse code tape. I'm going to TRY to find the time each morning to run through my tapes and perhaps I'll be ready to pass the test in a few months (then promptly forget the code since I'll never use it).

You got the point! ;-)

There seems to be a tendancy to figure that whatever part of this
that "I" am good at (be it cw, operating, antennas, or whatever)
is by definition what "you" should be good at.

Reminds of the way everyone defines "pervert" too.

It's what you do that I don't that makes you a pervert.
It's what I do that you don't that makes me good at it.

Wes-

By the time you see this, I suppose the swap meet will be history. How did you make out?

If you didn't get anything yet, you might check your local Radio Shack store to see if they have or can get, their HTX-252, stock number 19-1127. It is Two Meters only, and is not an impressive radio by any means. It is a 25 watt radio, but only has ten channels plus one call channel. Microphone gain is low, so you have to speak close to the top of the microphone! What makes it attractive is its current price.

A few weeks ago I purchased one when another radio started giving me trouble. At that time it was selling for about $89. Within the past few days, some of the Radio Shack Ham products have been reduced further. Even at $89, I think it is a good deal. If you get a better radio later, it would make a good spare.

Source record: 30869

Hey, the NAME CALLING isn't necessary or appropriate!

When I replied first to his query I thought of a comment but had second thoughts about even considering it.

Unfortunately and not the fault of the person who asked the question, the TECHNICIAN license is no longer a technician license as those of us who have been licensed for a while remember it. You don't have to do anything to pass the test but memorize, regurgitate and forget. (Much like almost every exam in the typical American school.) Thus the comments about the original question are not in line. He's just smart enough to play the system and the game.

Those who seem to think knowing how to apply "milli" to a unit is middle school math are RIGHT ON. I think I can teach my 7 year old grandson how to do it given 15 minutes. It's a trivial question that in a well educated population any 12 or 14 year old would be able to answer. If the US were smart enough to be on the metric system we'd all be able to do it with no problem. Unfortunately the American public feels that getting through school is a chore to be done with as little effort as possible and parents don't reinforce the school's attempt to TEACH SOMETHING. Everybody seems to think that a school diploma is a RIGHT and if it's too "hard" they are unwilling to work to learn. The American Public is all too often IGNORANT in anything to deal with science or math or even logical thinking.

The people who seem to think calculating levels expressed in or involving db is on the par with simple division and multiplication to manipulate prefixes are showing their own lack of understanding. Manipulating measurements to calculate db involves logarithms and is not the "simple" basic math that division and multiplication is.

Don't blame the "messenger," KC2SSB (sounds like a vanity call doesn't it?), he's only asking a question because the Tech license is now a memorize and repeat back and forget exercise. He's not a bad person or ignorant. In fact maybe he's smarter than we are because we studied and had to learn the theory to pass the licensing exams when they had a small amount of "meat" to them. He figured out the system and used it to his advantage.

Isn't that the "American Way" with the likes of Enron and others these days?

Yes, I'm licensed and have been since my teen years. Yes, I use a fake address. If you find a problem with that, great, you can ride the DEL key and deal with the spam that you receive but I chose not to. I try to minimize it. There are enough nuts out there that one who posts their real e-mail address and even their call is running the great possibility of being barraged by those who decide that they don't like how the person thinks or he/she is a target for schemes to get larger body parts, get rich, or help a Nigerian crook cheat their government. Don't waste

your time complaining to me I DO know where the del key is and e-mail filtering is pretty darned simple.

What you should do is make a starting price of let's say... $9.99, then set a reserve of what is the lowest price you will sell it for. You will find that the ebay auctions work better that way. Just a word of advice.

Setting your start price real close to what you want for it is not really an auction, and will result in very few, if any bids as is the case here.

So far, 62 "tire kickers" and not one bid.

"ham" <sp@m.me.not> wrote in message news:3EB3E244.69FD17E4@m.me.not...
Hey, the NAME CALLING isn't necessary or appropriate!
When I replied first to his query I thought of a comment but had second thoughts about even considering it.

Unfortunately and not the fault of the person who asked the question, the TECHNICIAN license is no longer a technician license as those of us who have been licensed for a while remember it. You don't have to do anything to pass the test but memorize, regurgitate and forget. (Much like almost every exam in the typical American school.) Thus the comments about the original question are not in line. He's just smart enough to play the system and the game.

Those who seem to think knowing how to apply "milli" to a unit is middle school math are RIGHT ON. I think I can teach my 7 year old grandson how to do it given 15 minutes. It's a trivial question that in a well educated population any 12 or 14 year old would be able to answer. If the US were smart enough to be on the metric system we'd all be able to do it with no problem. Unfortunately the American public feels that getting through school is a chore to be done with as little effort as possible and parents don't reinforce the school's attempt to TEACH SOMETHING. Everybody seems to think that a school diploma is a RIGHT and if it's too "hard" they are unwilling to work to learn. The American Public is all too often IGNORANT in anything to deal with science or math or even logical thinking.

The people who seem to think calculating levels expressed in or involving db is on the par with simple division and multiplication to manipulate prefixes are showing their own lack of understanding. Manipulating measurements to calculate db involves logarithms and is not the "simple" basic math that division and multiplication is.

Don't blame the "messenger," KC2SSB (sounds like a vanity call doesn't it?), he's only asking a question because the Tech license is now a memorize and repeat back and forget exercise. He's not a bad person or ignorant. In fact maybe he's smarter than we are because we studied and had to learn the theory to pass the licensing exams when they had a small amount of "meat" to them. He figured out the system and used it to his advantage.

Isn't that the "American Way" with the likes of Enron and others these days?

Yes, I'm licensed and have been since my teen years. Yes, I use a fake address. If you find a problem with that, great, you can ride the DEL key and deal with the spam that you receive but I chose not to. I try to minimize it. There are enough nuts out there that one who posts their real e-mail address and even their call is running the great possibility of

being barraged by those who decide that they don't like how the person thinks or he/she is a target for schemes to get larger body parts, get rich, or help a Nigerian crook cheat their government. Don't waste your time complaining to me I DO know where the del key is and e-mail filtering is pretty darned simple.

It's not math, it's arithmetic... which *is* a technical subject.

>middle school how to convert from "units" of anything to "milliunits" of

Actually, I learned at on my own at about age 10 when somebody
kindly gave me a copy of the ARRL Handbook. (A broadcast
engineer with KTNT-TV in Tacoma, WN which in the early 50's
built a transmitter site 1/2 mile from where I live on the other
side of Puget Sound from Tacoma. I came back 10 years later for
a visit, and he didn't remember the handbook but he remembered
that I knew the batting average of every major league baseball
player worth talking about... ;-)

>that same thing. Its in the same category of knowledge as converting feet
>to inches. Of course if basic math is considered technical this country is
>in real trouble.

What do you think *arithmetic* is, a study in philosophy?

Just keep in mind that the fellow who wasn't sure about watts to
milliwatts might know one Hell of a lot about some other subject
that you are totally ignorant of. He at least knew it was a
technical question! You seem to think that because it is simple,
to you and me, that it isn't technical. Wrong...

"M.E." <bogus@nospam.com> wrote in message news:vb7gm798prmn5b@corp.supernews.com...
What you have heard is true.
The ITU CW requirement is; spending or recieving CW at the rate of no less than 3 WPM.
For phone priviledges on bands 30 MHz and below.
It is likely that the ITU memebrs (which the USA is one). will vote to remove this requirement during the next meeting.
The CW requirements the each member country chooses is their option.
The US military recently removed CW as a requirement. However, US special forces still teach and use it for covert ops.
Next, the ARRL will need to make "ham radios" wishes known to the FCC, the FCC will likely make the desired changes after that.
Write the ARRL and make your opinion heard. The most numeruos and vocal majority will likely get the changes they want.

Don't read between the lines of this message, I'm not coming down on either side of this issue.
Whatever the "majority" decides, is what I'll go with.

Nope, it is not. It is a basic math question. You should have learned in middle school how to convert from "units" of anything to "milliunits" of that same thing. Its in the same category of knowledge as converting feet to inches. Of course if basic math is considered technical this country is in real trouble.

Actually, even a non-ham with a basic high school education should
have been able to answer the original question. It was only a basic
Metric system question. Obviously, this is another example of the
American education system failure.

Dan,

This illustrates not the dumbing down of ham radio but of our entire educational system. How to convert from units to milliunits is a middle school subject for basic math class.

Obviously a troll.
Most of us learned this stuff in grade school.
Certainly had to know it to pass an Amateur exam.

To answer your question, it is 300,000 microwatts.

That spectrum analyzer is an especially handy tool. It not only allows you to see the spectral purity of your oscillators, but, when used with a noise source, it allows you to see the frequency response of filters. I have just such a noise source design posted up on my website. It is a modified version of the ARRL circuit, but with RF amplification following the noise diode, so you can have about 0dBm of RF power across the spectrum.

Pete

Well I consider arithmetic a basic life skill. It is used in not only technical fields but non-technical. Balancing one's checkbook comes to mind as does adjusting a recipe for more or less servings than it was originally written for. Do you consider that technical? I don't. Math (or arithmetic) is one of those basics that applies to a wide range of fields including daily life.

Oh I see it how works, take the test before you know the Material. Then once you get the License, you can learn the material you were just tested on. It seems like that is the reverse order of how things should be. Oh well, I guess in this PC world we live in, its better to make some one feel good then to make sure they have any knowledge.

Math, arithmetic, etc. *is* a basic skill, just like spelling and grammar (all of which appear to be sorely lacking these days). Geometry, trigonometry, algebra, quantum physics, etc. are more technical. But simple units of measurement *used* to be taught in elementary school.

Unfortunately, 40 years of the educational system "lowering the bar" to accommodate the lowest common denominator has resulted in the lack of even basic math skills. The Wall Street Journal did an article some time ago that stated that an average person with a high school education from the 50's-60's has an overall greater level of education that a 4 year collage graduate today.

Just look at any fast food place, instead of a cash register, they have a terminal with little pictures of the food items. The employee only has to press the cheeseburger button, and the terminal tells them how much to charge and how much change to give the customer. Kind of like the current licensing structure... :>)

And this is progress?

1) Go look up "technical" in a half decent dictionary.
2) Go look up "arithmetic" in a half decent dictionary.

You will find that arithmetic, while it may be a very common and
is used and applied in many ways by many people, is still
clearly an application of a technical science or art, and
requires technical skill to accomplish... by definition.

Whether you want to consider it to be technical or not is
immaterial, it is *defined* as technical by the rest of the
world. Since we agree that the OP's problem involved
arithmetic, it is by definition a "technical" problem.

That is a very good point. In fact, the OP's question was not
where he went wrong. He goofed up by asking as bunch of assholes
for help. He should have found a copy of the Handbook, or used
google to find a reference online.

He asked what it is in milliwatts; hence, your answer is not
correct (even if you are indicating the same power level, you
aren't giving it in milliwatts).

How about -10 dBm0 at a +10 dBm TLP.

That specifies a correct answer.

Hate to tell ya Dee D. but this country has been in serious trouble ever
since the 'flower children' became tenured in our Universities.

No... the definition is not important. What is important is the fool didn't
know how to do it. And later admitted all he did was memorize the
Q&As...and admitted to KNOWING NOTHING.

This is what we are trying to tell you....HE IS A PRODUCT OF THIS COUNTRIES
EDUCATIONAL SYSTEM and it is pityful.

And some cannot make change, even if the cash register tell how much to give
back. BUT, put them on the customer side and they know exactly how much
to pay before it is rung up.

An FM transmitter is much simpler as it can be crystal controlled and
same for the RX.

Building a SSB transceiver for 6 or 2m is as many said not trivial,
I've built five but then I'm also an engineer. I also have a BIG
junkbox.

MY suggestion is build a kit or two and understand them first. Then
try a simple TX maybe CW then with some of the mentioned books and
a handful of old ARRL Radio Amatuer Handbooks you may embark on
experimentation. To be successful you will need good basic test gear
and fully understand how to effectively use it. The latter is very
important as now matter how good your design you will find a miswire
or bad part will require troubleshooting. Being able to fix a radio
is an important first step if you going to experiment.

Indeed it is. Also expensive to purchase and you have to understand
it to make sanse of the results. Building one is nearly as complex as
the SSB tranceiver task.

An aside, while I've had access to one I've done a large amount of
design and construction without it. There are ways to evaluate
circuits without a spectrum analyser. A good book on exactly this is
Experimental Methods in RF Design ARRL costs 35$ but is a excellent
reference and has a lot of already published work in one place. It's
also rather light on math for the phobes.

You just might have a point, there. While it bothers me a little bit that a ham had to ask that simple question, I suspect I have been guilty of similar things in the past. It is so much easier to ask things here rather than look them up.

Yes, one will risk dealing with us A**H***s frequently when doing it this way.

Probably one of them.

Lots of folks wait till the last minute to bid, $175 is not to far off the
mark... and it only takes one bidder to complete the sale.

I've offered up quite a few items in much the same fashion, essentially putting
the price I wanted for the item in question, and only looking for '1' bidder...

DeeD

That's not too bad. I told my doctor I had taken 6 tenths of a gram of
aspirin (325 mg/tablet) he said
"That's quite a bit isn't it." Oh well, some day we
will all be buying a half Kilo of hamburger. Or maybe 500 gm of hamburger.

Tell me Floyd...do like to take up for idiots? Do you know ANYTHING about this ANDY goof? I doubt it. Well he and I have a long history. Starting with his general attitude and going downhill from there.

If YOU have a problem with that...then GET OVER IT. In the meantime BUTT OUT.

Dan/W4NTI

Well, I started looking at the brochures and ended up with a Yaesu
FT-8900R. Matter of fact, I just opened the box. I bought it at 9
this morning and had to get over to my brothers for a concrete pour
and the day kept offering other distractions.

I kept looking at brochures and started thinking that up the road I
would want a more capabile radio and then I would have one I wouldn't
be using. It was neck and neck between the ft-8900r and the icom
IC-2702H. I liked the extended recieve range of the Icom but thought
that the yaesu might have better reach due to bands availible when up
in the UP of Michigan.

I went to my first today at the El Cajon ARC hamfest @ Santee Swap Meet.
It rained. Three hams were there around 7:30 a.m.
I picked a bad day.
Wanted to get an antenna, couldn't find the right one.

John, KG6OXA

After searching the entire web, and ICOMs own sites thoroughly, I find no reference to any IC-7800 from ICOM. Anyone else find anything? Perhaps it was just an unfounded rumor.

>
>Bob
>k5qwg

Well Bob, does this mean we all need to qualify for mensa to be
ham operators? That probably leaves you and me both out.

The fact is is makes *no* difference whether this stuff is like
water off a ducks back to Andy or to you or to me; we are *all*
entitled to enjoy playing with it regardless of how technically
adept we happen to be. For all we know Andy might be *very*
accomplished in some way that we are not. (I notice he isn't
exactly slow when it comes to being logical, while virtually
everyone jumping on him is prime fodder for every flim flam
artist with a half decent pitch.)

As a retired professional from the telecommunications industry,
I don't find most ham operators to be particularly well informed
when it comes to communications technology, but that is no
reason to deride them individually or as a group. I happen to
enjoy twisting knobs, and if the vast amount of experience I
have can help someone else enjoy that too, it really doesn't
matter whether they can understand 1/10,000th of what I do, does
it?

What makes *you* so fucking special that you set the standard?
How about if we just look around and find someone (anyone) who
knows it just a wee little bitsy bit better than you, draw the
line there and then start calling you a fucking idiot because
you can't keep up with "The Standard"!

Or we can just help each other have fun twisting knobs, eh?

Really. That must be 500 miles from here, not exactly in the same neck of the woods... but there are similarities. I assume you were on a vacation curtesy of the USAF? (You'll be happy to know that today they figure you poisoned half of the Bering Straits with PCBs while you were there... for some reason they focus on that site and ignore the other AC&W that were just as bad or worse.)

I was over at Tin City, operating the White Alice troposcatter system to North East Cape, in early 1968. I've been to Savoonga and Gamble too. (To polish up the small earth stations before Alascom sold them the United Utilities Inc in the late 80's.)

And I maintained the AT&T Alascom earth station at Cape Lisburne for 4 years from here in Barrow before retiring. So those old AC&W sites are pure nostaglia for me.

Like I said, I picked the wrong day. If this was Seattle, it would always rain and swaps would
likely be inside events. Nevertheless, I should be set as far as gear by the time I move up there.

Nada. Just some reference to a Philips HDTV processor chip or something to that effect.

John

POSTED AGAIN BECAUSE OF SERVER PROBLEMS - SORRY IF APPEARS TWICE.

Thanks for the suggestion, both Mark and Roger. However, I've already built a few kits. And while I did learn some from those kits, it was certainly not enough to build my own VHF radio without serious guidance. There are still simply too many gaps in my knowledge about electronics. In other words, I'm still a beginner in too many areas. Because of that, the books I've seen on radio construction lose me fairly quickly. Therefore, I was hoping for a book that didn't assume so much knowledge on the part of the reader. With that, I could probably muddle my way through to a fairly basic radio.

I'm prepared to spend a reasonable amount of money to purchase the equipment I'll need. Assuming I don't have to buy the most expensive of everything, nothing in the equipment catalogs shocked me. I also have some minor experience with various test equipment.

Thanks for the various suggestions. I'll keep them in mind.

> You might be able to get a surplus FM rig
> that can be modified to amateur bands if
> you dont want to build your own.

Actually, my first idea was to purchase a basic SSB kit and try building it up from there by adding capabilities. I may still do that.

I also searched and found nothing.

It may just have been BS but I did hear it from a source who is a big
name in (R&S) the radio world. We'll just have to wait and see at
Dayton.

Hi John,

I went to my first one yesterday also. It was inside at a Jr High in
Cadillac, MI. and it looked like it had good attendance. Went looking
for a mobile 2m or 2m/70cm and ended up with a quad bander.

It reminded me of a gunshow. People selling good stuff, people trying
to sell used for new prices, and wild prices on old stuff.

I have a FT-401B that is a fixer-upper or can be used for parts. It has high voltage and power for the cicuits and it has all the tubes except for the finals (6KD6s) , The front panel is in good shape and the case needs repainting. I did get some static from the speaker , but it needs alot of work and it is a little on the rough side. I am asking $60 for it and you ship (it is heavy!), If you are interested I will e-mail you pictures of it. Thanks ,Rob WB8VWI

I wouldent but I remember back a ways in time when the KWM380 came out
and folks were saying the same. Also look at how many 781s are around
and that was in the same price range. So they will sell.

>Yep they sent me to HELL for doing nothing wrong.

I always felt sorry for the enlisted GIs. Those AC&W sites were literally a penal institution for officers who'd screwed up big time. One out of ten officers were there because they were just unfortunate enough to have thier name drawn out of a hat when nobody was available who deserved it. The other nine out of ten were there because they had *really* fucked up somewhere and that was the penalty. (That is a *fact* too, not just a good story.)

However, the poor enlisted people were all there because of just plain *bad* luck, and they had to suffer having the worst officers the USAF could find. For most of them it was just like serving a year in Leavenworth. The officers at least got to go to Nome two or three times in a year, but some of the poor GI's were never even allowed out of the building in their entire year!

North East Cape wasn't as bad as the others though, because there was the village close by. At Tin City the nearest village was 10 miles over the mountain. At Lisburne it was 30 miles across the bay, and at Romanzoff, Newenham, Indian Mountain and places like that it was much farther and more difficult.

>>(You'll be happy to
>>know that today they figure you poisoned half of the Bering
>>Straits with PCBs while you were there...

Unjustly too, because TNC and LUR certainly were at least as bad. There were literally 2 miles of 55 gallon drums (empty and partially empty) stacked on the beaches at both TNC and LUR. Thousands of them.

> Yea I had read that. The place wasnt worth much more than that anyway. Glad to
>have helped out. I wonder what ever happened to that Slut Sharron down at Skimo
>Village?

Oh, I see. You've always been an asshole that can't deal with people in a polite way. She probably raised your child to be one Hell of a better man than you are!

>>I was over at Tin City, operating the White Alice troposcatter
>>system to North East Cape, in early 1968.
>
> Thats when I was there. I use to operate the Mars Station there, mostly on Ham
>Radio.

I spent one day in the Mars shack at TNC. But it wasn't comfy.
There were some real social problems going on when I was there,
and there wasn't much a person could do about it other than leave,
so I did. The White Alice supervisor was an idiot (something like
the officers!), and so was the site mechanic. They spent a lot of
time annoying the GI's, and it was hard enough for young fellows
to understand why some civilian was there, reportedly making huge
amounts of money, who could get on an airplane any day he wanted
to, but didn't. The supervisor basically lied to them in a different
way every day, so they didn't know what to believe. The result was
a lot of envy and hatred taken out on the 6-8 civilians. None of it
had to be that way, but one rotten apple spoils the whole barrel.

So I managed to get a transfer. In a fun way!

The White Alice facilities mechanic was a State Senator from the
village of Teller, which is maybe 50-60 miles south of Tin City.
He was well known to be a hothead, and idiot, and had been
perviously fired off the DEWLINE and White Alice both. But the
company felt that politically they *had* to hire him. So there
he was. The supervisor thought he was sent there to "get" him.

Of course, I was young and didn't know any of the above at the
time, I just knew that as the junior tech I had to room with
him, and he was a total jerk. He wouldn't do a thing to clean
up the room, for example. He had a *lot* of annoying habits.
So I developed a few of my own! For example, I bought a pair of
rabbit hide slipper from an Eskimo in Wales. Of course, they were
urine cured slippers! So I'd lay down on my bed after dinner
and read, with a blanket over my feet so they would get hot and
sweat. When Bob came in the room, I'd slide that blanket off my
feet, and let the whole room fill with the aroma. Tsch tsch,
two can be assholes!

One day, he did exactly what they figured he would do. He blew
his cork and started swinging at me! That's bad news. He was
on a plane home to Teller that afternoon. A week later they
brought me into Anchorage and re-assigned me somewhere else. I
eventually found out that they'd expected exactly that to
happen. I had people that I didn't know asking for five years
later if I was the guy that got him fired, and then want to
shake my hand for doing it! 34 years later I retired.

Bob Blodgett passed away some years ago, but while he was my
roommate he bought a telephone switch and later intalled it in
Teller, and then did the same in a couple other villages. He was
a thorn in the side of Alascom, which became the franchised LD

carrier in Alaska and bought the White Alice Communications
System. We *all* hated that asshole, and had a party the day we
heard he finally kicked the bucket.

4273. Tower Wanted from Holland

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-04 18:45:00 UTC
From: Martin <martinessex@telecom.net>
Message-ID: <b93nch$f7g7v$1@ID-167701.news.dfncis.de>
Source record: 30705

Can anyone help with this enquiry.

I am looking for a second hand tower by Strumech, Versatower or similar, but I want
to export it to Ethiopia, where I live. I have a forty foot container coming out soon from Holland and I am thinking of sending the tower out in the container with
other business items.
Therefore, if anyone knows of any dealers or second hand sales in Holland I would be very interested in the information, or a way of getting a tower into Holland at a reasonable cost to meet up with my container.

I am looking for a 20 metre unit, winch up and tilt over in very good condition, with rotator cage if possible. I am not too bothered wether the design is the ground post type or base plate.

Any responses will be very much appreciated,

Thanks,

Martin

If this new radio is based on only DSP filtering then even if I had the kind of fun money to spend for it I wouldent. So far none of this DSP stuff has really impressed me much except for the autonotch which is handy.

4286. Help with programing a Maxon mobile needed

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-04 20:32:51 UTC
From: Paul Henry <p.henry@whsmith.net>
Message-ID: <3eb578f3$0$4864$cc9e4d1f@news.dial.pipex.com>
Source record: 30718

Hi all

A freind has suggested that I place a post in here in the hope that one of you guys may be able to help me out

I have a Maxon mobile radio a pm-150 I have the software for it but someone has told me they think that all the stuff is proggramed on an eprom and not through a pc into the radio such as a motorola.

I dont want to leave the set just sat on the shelf if it can be used but I dont have any experience of maxon radios only motorola and tait.

I know it might seem a basic thing but can somone tell me what equipment is need to program this set or is it just easier to throw it someone else and start with a set I know, I will be getting access to a couple of these in the future and if I can get the equipment to do them it will be worth it will get used.

Thanks guys hope someone out there can point me in the right direction.

Oh one odd thing I know its OT for this post looking for a lead for a motorloa gp340 from rib to radio if anyone has a schem or any ideas were to get one please post or mail direct TIA

Paul

hamcom:
see http://hamcom.org and http://www.arrl.org/announce/nc/2003/
on june 20-22nd will be a great chance to really find some ham gear ;-)

see http://people.smu.edu/arc/sidewalk.html on Dallas biweekly sidewalk
sale; this is a nice opportunity to pickup odd items and bargains, though
it has gone heavily computer stuff in the last 10 years or so.

However, at yesterday's sale, I picked up a number of clip-on test leads
($1.50), banana plugs ($.50), two op amp power supplies ($2), a 12v 5amp
and 5v 35amp p/s ($1), some lavelier microphones ($.25), plus batteries
and books and blank CDs etc. This stuff adds up - ;-)

good luck! bobm

As of May 4, 2003, this group has more than 394 members with 957 archived messages, dozens of files, photos and links for mods, tips and docs. If you have a DX-394 or are interested in finding out more before getting one (there's almost always a few for sale or auction on eBay), join us. Our group has the most comprehensive set of mods, tips and docs among all the SW radio groups - reflecting the opinion of one reviewer who called the DX-394 a "hacker's delight" and the need for improvement that has caused many to trash the radio - both literally and figuratively.

A sub-group with 57 members was formed on Jan 29 to focus on modifying the DX394 for computer control. This group is at http://groups.yahoo.com/group/DX-394C/ .

73, Tom VE3MEO

4295. FS Kenwood TM-2570A Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-04 23:26:34 UTC
From: Charles Hugg <chashugg@earthlink.net>
Message-ID: <Kkhta.55718$4P1.5153027@newsread2.prod.itd.earthlink.net>
Source record: 30727

I have for sale a nice Kenwood TM-2570A 2 Meter FM Transceiver. This transceiver is in very nice shape and works fine except that the volume control only works in one spot-- almost full open!!! Loud. I have tried to clean it, but it is sealed. It will have to be replaced. Otherwise this is a great little mobile 2 meter radio and it has the hard to fine TU7 Tone Board. It includes the original box, the manual, the mic, and the mobile bracket. It puts out 70 watts or 5 watts. It has been used very little. The dial lights all work. It would make a fine transceiver for someone who has the skills to change out a $2.00 part. Not me, though. Price is $75.
Thanks, Charlie Hugg, K5MBX

>
> No I haven't, but why would anybody pay that kinda of Money for a RADIO?

Don't let the price intimidate you. The new radio will target the same market sectors as did the IC-781 in its day - mil/gov, commercial and those amateurs who are willing to pay $6000 or more for an HF transceiver (as they did for the IC-781 in its time). According to our information, the new radio will incorporate technology licensed from R&S - a very strong plus factor in these market segments.

For the non-amateur user, the IC-7800 (or IC-788, pssibly IC-785) is a bargain even at $8000. An R&S XK2100 costs $20 - 30K, depending on options. A Rockwell-Collins HF-9500, or an equivalent Harris system, can cost as much as $70K (or more). Also, in the intended target markets, the purchaser often is (or at least controls) the radio regulatory service, so type-approval issues as we know them simply do not arise.

Hi,
I have a brand new European Unblocked Icom R-5 Reciever I would like to swap for a Yaesu VX-7R.
The Icom is only one month old and has the box,manual, set of nicads and a nice leather soft case.
Radio recieves from .5 to 1300 with no blocks.

Hi folks,

I have a very old Hallicrafter SX-110 transceiver in good operating condition. Is anyone out there collecting this type of equipment or is it just a candidate for the dump?

If there is any interest please advise best avenue for sale. Direct email (sanking@clemson.edu) would be best as I don't read this group very often.

Sandy King

I was there too! Alot of junk and people selling used crap at new prices!
Ten year old mobiles being up for sale for about 10-20 bucks less than what
they paid for them. Funny to see they did not sell them anyways.

Found a few scanners though.

Please disregard my 2m antenna threads.

I have decided on a 2m log periodic with 1:1 swr and a 24" boom which is fantastically great.

Thanks for your responses and I believe this is the right one for me.

73s

Not only the education system but also the fact that the US and Canada are the ONLY countries that have not fully implemented the metric system.

I remember from my early school years when we converted, that for a number of years it was flat out ILLEGAL to manufacture or import ANY non-metric measuring equipment of any kind unless you could prove a vital NEED! Result: almost painless metrication and any 10 year old kid can tell you "milli" means 1000th.

Doesn't the UK still use miles extensively? Also, Korea doesn't use
exclusively metric weights and measures, they have their own old weight
system they use (1 Kun= ~300gm or almost 3/4 lb.)

From: John Furlow <wa4bmg@bellsouth.net>
Message-ID: <tsrta.58744$1S3.50906@fe03.atl2.webusenet.com>
Source record: 30741

Does any one have any experience or knowledge about the FT857 causing
inference to automobile electronics.
I have a 1998 Dodge Ram Van that has developed a problem with the ABS brake
Computer that may be related to RF interference.
I ran a IC 706mk2G for several years in the same vehicle with no problems,
but now that I have switched to the FT857 I seem tohave strange problems.
Also when I key up an AM carrier on 40 meters , it will operate my electric
door locks. Any information would be helpful.

Please reply: wa4bmg@bellsouth.net

- isn't that just awful? although not unexpected...

- 'whatever the market will bear' seems to be the mantra of ebay, but
in many cases it is more like 'there's a sucker born every minute'

- my guage for ebay items, especially for those items i'm familiar with,
is 10 percent over cost and a reasonable shipping fee... so, if i
know there *may* be some htx-200s sitting somewhere on a shelf, and
the closeout is $25, then i wouldn't mind paying around $30 + $5 S/H

- anything over that is absurd, and i'd have to really, really, really
need the item - impulse buying can kill the pocketbook and one's budget

I heard it's a IC-785, the numbers may not be correct, but strong
information says there will be a new Icom hf radio to replace the 781.
Big bucks though, 6 to 8 K dollars.
Not for me though. I'm stuck with my 775 which I like a lot, this is my
second one.

I just got off of the phone with Toyota.
they told me that if a radio transmitter requires a license to operate,
then it's too powerful to use in a 2003 Toyota.

If you want to install a ham radio in your car without voiding your warranty,
then I guess you should not buy a new Toyota like I did...

Aren't those sorts of venues using CCTV feeds, rather than RF, which would
tend to be problematic at best in those circumstances?

Great teaser.
So what's the symptom?

You have apparently been talking to the Toyota Dept. of Morons, because
a license has nothing to do with power.

So does that mean that if you were a CBer with a 100W linear you would be ok
in a Toyota?
I think maybe whoever in Toyota doesn't really understand what they are
saying. I think maybe a talk with someone else in Toyota is in order. I
would almost guess (and it's only a guess) they're probably concerned with
interference with a computer somewhere in the vehicle, but wouldn't the
operating frequency be more of a concern that the power output?
I wonder what would happen if you were driving down the road in your
Toyota and someone was right beside you with a 2 meter rig and transmitted.
Would you car all of a sudden become erratic?

I'll stand to be corrected but I believe and understand that all
vehicles must meet FCC part 15 requirements.

I'd check with a better authority at Toyota.

This isn't the first manufacturer that has said this.. right in the owner's
manual of our new Chevy Tracker it says not to install any radio
transmitting equipment without consulting the dealer service facility.

:(

I'm a newbie HAM so if someone could fill me in here.......
We have a 2002 Toyota Sienna, are we talking that a HT with an output of around 6 watts could mess the car up, or are we talking full mobile radio with an output of 50W? (I'm sure my parents would not be happy if I messed up their new car :(

I know this is a newbie question, but if someone could fill me in I'd appreciate it!

Thanks,
Greg

Greg,

Good idea to contact a dealer service dept. Computers can be very sensitive
to RF, I know that my laptop tends to lock up if I use my HT in close
proximity to it.

Mercedes says not to use any transmitter with a built-in antenna inside the vehicle - and they apparently intend to even exclude handheld (600mW) cell phones. So long as you use an external antenna, then they're happy. They do provide an external cell phone antenna hidden in the bumper cover somewhere.

Obviously, they've painted the line a bit wide... I would think that an HF kilowatt with an external antenna would produce more EMI issues than a cell phone. And if a handheld cell phone really caused a problem, then we would have heard about it by now and they'd still have to fix the problem (due to market forces).

The automotive EMI issue is serious - in spite of the nonsensical boundaries quoted by the car makers. Modern cars have CAN bus, on-board diagnostics, as many as a dozen pyrotechnic devices, low voltage switching (signal, not power), sensors on everything, etc.

Even on my previous car, an old 1986 VW GTI, I could make various relays click when transmitting with 50watts on 10m with a rooftop antenna. I still wonder which relays were clicking... I just ignored the clicking. I wouldn't take such an approach today.

Next time buy a vehicle that doesn't decimate the US machine tool
industry from a company that hires U.S. engineers. Or uses the U.S.
as a source of cheap, compliant labor. Sort of like a third world
country.

Well 2m HTs and the low setting on most mobiles is equal or less than that used by a CB. So they are giving you the "short answer" just to get you out of their hair and to set up a CYA for themselves if you go ahead and put in a radio. Of course you could run into problems such as low voltage, alternator whine, your transmissions disrupting the car's systems but Toyota probably doesn't have the answers and so is taking the safe way out.

My Dodge Stratus manual says something to the effect that the car is
designed to accommodate radios BUT they will not guarantee that it will.
Putting a radio in is at the user's own risk.

Source record: 30630

Hi All;
My Friend Gary asked me to sell this for him.
He's kinda old & computer illiterate, says there are too many features & his memory won't allow him to enjoy it as much as he would like
The radio is the Yaesu VX-1R, comes with original box, manual, ducky, wall cube, original FNB-52LI lithum ion battery, extra belt clip & the carry strap.
Plus he bought this FBA-20 battery case which holds one(1) "AA" battery of your choice.
The radio works fine & is almost mint.
Unfortunately, Yaesu may have messed up by printing some functions directly on the buttons, this wiped off almost immediatly
Still a good deal for someone with good memory
Price is $80.00ppd.

Surprisingly it was fuller than last year. The tables went way back into the junior high where the gym might be.

As far as my comment goes..... Two different Radio Shack HTX-212 mobiles, which are the predecessor to the HTX-242, attempted to be sold for $110 and another for $120. What a joke. Both of those are not worth much over $75 bucks.... There is a simple thing called depreciation and apparently that wasn't in their vocabulary.

Sounds like issues of the vehicle's equipment not being shielded or grounded
properly. On six meters there are some frequencies that I can make the
headlight/door open warning turn on......

Before I bought a new Highlander, I called Toyota corporate customer service and asked if they had any service bulletins regarding installation of two-way radios in their vehicles. Answer: No. Then asked if they prohibited installation of two-way radios in their vehichles. Answer: They didn't recommend it, but they didn't prohibit it. Asked the local service manager if he had any advice or experience installing two-way radios in Toyotas. Answer: I haven't got any idea...click. (Needless to say, the local service department won't be seeing me for routine service.)

I'm in the process of installing an Icom 706 w/ bumper mounted hamsticks for HF and an on-glass antenna for 2-m and 70-cm. Guess I won't run full power at first......

It wasn't until I worked in an RF lab, before I was able to think in terms of dBm, and not watts. Another new term.....what the heck was return loss? I never even heard of that term before then. I used to always think in terms of VSWR. Like you said, just takes getting used to. Good point.

I purchased a Toyota in 1993. The service manual said that I could not use a transmitter in the car if it was over 10 watts I contacted Toyota customer support and they told me that I could use up to 50 watts and that they would change this in the 1994 service manual. I never did have a problem with my car from my radio. I just did not want them to be able to void my warranty based on the fact that I had installed a ham radio in my car.

I just purchased a new 4 Runner and while I was going through my paperwork for the old car, I came across the letter that Toyota had sent to me. This reminded me that perhaps I should ask again what the limit is now. I was stupid for not doing this bit of research before I paid for the car. When I contacted Toyota yesterday, the told me that "using any radio in the car that requires a license would void my warranty" and they would be happy to put that in writing and send it to me.

I am outraged because you could use a CB radio without a license. Output 4 watts into a mismatched antenna, and by their wording of this limitation this would not void the warranty. However I could use a 1 watt transmitter with a 1:1 match and I would technically be voiding my new car warranty.

Toyota's statement is way too harsh. It would exclude they use of any public service, ham, or even GMRS transceivers. Toyota needs to change their statement to be more realistic.

I know I was talking to a Moron at Toyota

I asked them if they wanted to reconsider making such a harsh statement
regarding their product. They said that they had already checked this out
with the department in charge of these things and that "any radio transmitter
that requires a license to operate is too powerful to use in their vehicle
without causing damage to the ECM because their engine uses so many
sensors." "the fact that Toyota changed their manual for me in 1993 did not
apply in this case because the ECM used in the 2003 4 Runner was more
sensitive than the 1993 model". They are going to send me a written statement
documenting this fact.

I guess I should not drive next to my local 1.5 Megawatt AM radio station or my
car might fail. Perhaps I should not slow down if a police car is behind me
because they might transmit a radio signal that will cause me to have an accident.
:-)

The people working at the Toyota Customer Assistance Center are complete idiots
that don't understand the first thing about radio frequency and radiated power.

Perhaps the car I just purchased is total junk if the sensors are so sensitive that
Toyota is afraid of a 500 mw GMRS HT.

Toyota, are you listening ???
You should clarify and change your rather harsh statement regarding this issue.

I am already sorry that I did.
However I think that this might go a bit further than one car manufacturer.

Are there any ham friendly car manufactures out there, U.S. or otherwise ?

That is the point ! If the car electronics is so sensitive that any
transmitter
in the vicinity becomes a danger, the whole car is a danger because it
cannot
be used in the real world, where transmitters can be near at any
location, even
if they cannot be seen.

A number of years ago, a german manufacturer issued a statement that
any transmitter that had an output power of more than 5W would
void warrantee.

I don't know if this was a 'corporate' statement, or something that came
from one of their 'groups' without being blessed by home corporate,
but it caused quite a stink on CompUServe at the time.

Contact the ARRL with a copy of the letter you received.

Then write their home office a nice letter telling them that the car does
not have an expectation of servicability if they hold to that statement,
and ask them how you should procede, in case you want to refund
the vehicle. Be polite. I'm sure you'll get a polite response. And
maybe wake up more of their corporate as to what kinds of morons
are allowed to send out 'corporate policy' letters.

But GM (and Ford, Chrysler, and a lot of others) have SUGGESTED
installation guidelines for radio installation that DO allow, and even
assist you, in installing high power (over 100W) transmitters with
minimal impact to the vehicle.

I wonder... WHO did you call at Toyota? Someone really in a position
to make a statement like this? Or a low level moron that can't answer
without having someone else to blame?

Maybe you didn't really get a 'corporate statement of policy' just some
low level no-nothing trying to sound important.

THIS I would want in writing. With a name on the bottom...

Saturn, no warranty problems with an ICOM 706 installed! In fact, they advised compatibility up to 1000 watts.

Ford [Ranger], Sales/Service were advised prior to purchase and indicated no problem with 706 installation.

I believe that it is necessary to advise them that the radiating antenna is located OUTSIDE of the vehicle. The vehicle then becomes part of the rf shield for the sensors/computers etc.

I thought that Saturns were mostly ~plastic~ body panels around a 'Swiss cheese' metal frame. I suppose the openings are small in comparison to HF wavelengths...

PS:
:-) Saturn cars have nice seats - they're good for Uranus. :-)

Strange things can happen. When I tune up my 706 on 40m in my
1996 GMC pickup, the speedometer pegs at full scale whether
I am moving or not.

4368. Problems with WWVB Atomic Clock time signal ???

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-06 12:58:26 UTC
From: Weather Man <Weather@Man.com>
Message-ID: <3EB7B172.69FF1868@Man.com>
Source record: 30648
Cross-posted to: alt.talk.weather,rec.radio.shortwave,sci.geo.satellite-nav,rec.radio.amateur.equipment,,sci.astro

Have an "Atomix" wall clock that shows indoor and outdoor
temperature. Two nights ago (sometime before 10:30 PM EST)
it was showing the time to be exactly 40 minutes faster
than actual time. Last night I hit the "Wave/Set" button
countless times, moved the clock to different locations,
changed the batteries. Nothing worked. In fact it failed
to receive the WWVB signal at all (when I changed the batteries
it reverted to 12:00 01/01). So I left it on a table.

This morning, low and behold, it's working again. It's got
the right date and time.

Was there a problem with the transmitter that transmits this
signal? Was there a regional problem? (I'm located near
Detroit / Cleveland).

Saturn's, at least my SL-1, had metal roof, metal trunk lid, metal
engine bonnet, etc. All on the honeycomb frame with plastic side panels
and door panels.

Put 120,000 miles of HF mobile on that car before I gave it to my
daughter. BTW, it's still running great!

According to the WWVB outage record at
http://www.boulder.nist.gov/timefreq/stations/wwvboutages.htm
the last outage was April 23 and lasted 7 minutes.

I had a Pontiac Grand-Am of the same vintage and when I transmitted with 30 watts on 2 metres my speedometer moved up about 10 mph, however there was no effect on the cruise control, just seemed to be the meter.

A 1976 Honda Accord had a left turn signal which would flash at a fantasic rate when using the 2 M tx. But no effect on the right turn.

My 1998 GMC Jimmy had continuing problems with the elctronics and the dealer, made me remove my radios and aftermarket security/remote starter before they would debug it - turned out it was the vehicle's fault and not anything I was doing.

I would also send a copy of the letter to Consumer Reports. They might
be interested in RF susceptability. It would certainly get Toyota a lot
of publicity if they published something about it.

These clocks listen to the standard time broadcast from WWVB which is
on a frequency of 60 kHz (that's kilohertz, not Megahertz), which is
way below the broadcast band.

This is a very accurate broadcast, but there is a problem with the low
frequency. It's impossible to get a decent antenna at that freq. A
quarter-wave vertical, which is a minimal configuration, would be 1250
meters (almost 4000 feet) tall!!!

Consequently, these clocks are sensitive to position. Also, they only
check the time typically once per day, sometime after midnight local
time. It takes several minutes to receive the time even when the
system is working properly. If you hit the Wave/Set button and
expected it to change immediately, that's not the way it works.

Probably just a propagation anomaly. You should have a decent signal
in Detroit. The transmitter is in Boulder, Colorado.

Hello to All,

I have a Few Collins stations for sale....

Collins (winged) 75S-3 receiver
Collins (winged) 32S-3 transmitter
Collins (winged) 516F-2 power supply
with manuals, and microphone.....$1200.00 plus shipping

Collins KWM-2 (winged) transceiver
Collins PM-2 power supply
manual, and microphone.....$800.00 plus shipping

Collins (winged) 30L-1 amplifier.....$550.00 plus shipping

All these units are in good to great condition with original condition. They
have been checked out by Wayne Spring W6IRD a Collins Collection Member.
They are presently at his home for viewing.

Thank You

Leo Fahmie KJ6HI

It's not just Toyota. The owners guide for the 1998 BMW motorcycle I
used to own said operating a transmitter on/near it might cause the
brakes to malfunction. A ham who worked for BMw said it might QRM the
anti-lock brake computer but that he'd used a 5W handi with no ill
effect.

OTOH my Dodge PU has 7 !! computers running everything from "engine
management" to dash displays and I have a 50W dual band feeding a mag
mount. No problems - but YMMV so ...

I suspect you may have received a corrupted "minutes" code probably due to some local interference of some type. This was corrected the next time the clock "checked in" with WWVB. There is no error correction on the WWVB signal as far as I know so I could see how it could happen. I have three of these type of clocks and have never seen it happen on any of mine.

In checking into this a bit deeper, I see that the first pulse in the
minutes code has a weight of 40 so that would account for your error. Take
a look here: http://www.boulder.nist.gov/timefreq/stations/wwvbtimecode.htm

4385. FS: Old Radio-Related Books, 1930's - 1980's

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-06 17:55:04 UTC
From: oldbooks78@aol.com
Message-ID: <20030506135504.04869.00001041@mb-m05.aol.com>
Source record: 30667

I currently have the following old radio-related books for sale. Postage is $2.50 for the first book, and $1 for each additional item (Media Mail within the US, at cost elsewhere). The books are:

Jordan, Edward C.; Paul H. Neilson; William Carl Osterbrock; Fred H. Pumphrey, Lynne C. Smeby "Fundamentals of Radio" Prentice-Hall, 1945. Twelth printing. The 400 page hardbound book is in very good condition, clean with no page tears or pen marks. A nice early text on radio design and principles of operation, including a few fold-out schematics. Price: US$ 10.00

Everitt, William Littell "Communication Engineering" McGraw-Hill, 1937. The 727 page hardbound book is in about very good condition. Clean with no page tears or pen marks except for a previous owners name and address inside the front cover, and a few passages underlined in pencil. A nice early text on the science of the radio. Price: US$ 9.00

Frost, J..M. (Editor) "World Radio TV Handbook, The Authorative Directory of International Radio and Television (Volume 39, 1985)" Billboard Publications, 1985. The 600 page softbound book is in very good condition, clean with no page tears or pen marks except for a previous owners name and date at the top of the Table of Contents. Price: US$ 4.00

Measurements Development Laboratory of the Sperry Gyroscope Company "Microwave Transmission Design Data" Sperry Gyroscope Company, 1944. Publication No. 23-80. The 215 page hardbound book is in very good condition, clean with no page tears or pen marks, and a strong binding. Originally issued during WWII as a "confidential" document. Chapter topics include General formulae for concentric lines; Attenuation in concentric lines; Reflections and impedance matching; General formulae for wave guides; Attenuation in wave guides; Reflections and impedance matching in wave guides; Wave guide tees and bends; Wave guides filled with dielectric material; Dielectric material: Cavity resonators; and Measurement techniques. A neat early book on ultra-high frequency radio waves. Price: US$ 7.00

Worldwide Publications "White's Radio Log, Vol. I, Number I" Worldwide Publications, c1982. The 136 page softbound book is in good+ condition, clean with no page tears or pen marks. Not dated, but looks to be from the early 1980's. A directory of North American AM, FM, and TV stations including world-wide shortwave stations. Price: US$ 3.00

American Radio Relay League "The A.R.R.L. Antenna Book" American Radio Relay League, 1960. Nineth edition. The 320+ page softbound book is in good condition. The covers show some wear from previous use, there are a few bent page tips, and there is a previous owners address label inside the front cover. A good solid reading copy of this informative text on radio antenna technology. Price: US$ 5.00

Federal Telephone and Radio Corporation "Reference Data for Radio Engineers" Federal Telephone and Radio Corporation, 1950. Third edition. The 640+ page hardbound book is in very good condition, clean with no page tears or pen marks, and a strong binding. A nice early edition of this classic radio reference data text. Price: US$ 9.00

Beam, Robert (editor) "A Dictionary of Electronic Terms" Allied Radio, 1959. Soft Cover. The softbound 80 page book is in very good condition, clean except for a previous owners name marked out inside the front cover. Concise definitions of words used in radio, television and electronics. Price: US$ 2.00

Institute of Radio Engineers "Proceedings of The Institute of Radio Engineers, October 1933" Institute of Radio Engineers, 1933. Volume 21, Issue Number 10. The approximately 200 page softbound book is in good+ condition, clean with no page tears or pen marks. Some moisture discoloration to the spine area paper, but not too bad, and not affecting the inside pages. Includes a foldout-out figure of oscillogram readings. Price: US$ 8.00

Institute of Radio Engineers "Proceedings of The Institute of Radio Engineers, December 1937" Institute of Radio Engineers, 1937. Volume 25, Issue Number 12. The approximately 200 page softbound book is in good+ condition, clean with no page tears or pen marks. Some minor wear to the spine paper, but not bad at all. Page tips in rear lower corner bent outwards somewhat. Price: US$ 8.00

Institute of Radio Engineers "1933 Report of the Standards Committee of The Institute of Radio Engineers" Institute of Radio Engineers, 1933. The 225 page softbound book is in good+ condition, clean with no page tears or pen marks except for a previous owners name on the front cover. Some wear to the spine paper, but not too bad. Page tips in rear lower corner bent outwards somewhat. A neat look at standards development for the radio in the early 1930's. Price: US$ 8.00

US War Department "Technical Manual - Radio Fundamentals, TM 11-455" U.S. GPO, 1941. The 140 page softbound book is in fine condition, fresh and clean inside and out except for a previous owners name on the front cover. A nice WWII vintage radio manual. Price: US$ 10.00

Or, all of the above for $75 post paid. If interested in any of the above, please email to "Oldbooks78@aol.com" to reserve. Thanks.

Dave

I received a similar letter in 1994 for my 1993 Toyota 4Runner.
Here is a link to that letter:
http://www.geekdude.com/toyota-rfi-1994/

I expected the same type of response this time.
The response I got yesterday was totally unacceptable.

I spoke with the Toyota Customer Assistance Center.
They will send me this statement in writing.
I will post the letter on my web site when I receive it.

This is the same department that I received a letter from in 1994
that said that I could use up to 100 Watts using certain installation guidelines
http://www.geekdude.com/toyota-rfi-1994/

A common failure mode of these clocks, especially the older ones and
if you're a long way from Colorado. Most of these clocks don't have
the power budget to monitor WWVB continuously (and day time propagation
makes it impractical much of the time anyyway). Note that the WWVB
data protocol contains *no* form of checksum or other way to validate
that you've got a good set of data, so clocks do things like wait
ntil they've gotten two identical (off by one minute) sets of data
in a row. Unfortunately this makes it all too possible to get errors
such as the one you saw. But hey, when it's wrong it's generally
off *exactly* some number of minutes, since the "seconds" are
determined independently from the data stream.

So if I understand that article correctly...

Cars are not shielded properly and possibly un-safe
when exposed to RFI. As cars are mostly plastic these
days, I don't see how they would make a good faraday cage.

If a cell phone on an airplane is un-safe because it
might interfere with the on-board electronics, then
the same might be true about all modern cars. The car
manufactures must know how un-safe their cars are if
they are making statements like using any radio that
requires a license in your car will void your warranty.

I would like to think that my car would be safe from
cruse control malfunction if I drive by someone
operating a 2 way radio.

I am starting to doubt the safety of all modern cars.
Perhaps the car manufacturers should put in some shielded
wiring and lower their profit margins in order to ensure
safety when consumers use their products in a world of
wireless communication devices.

Modern cars have a life threatening design flaw
and they are trying to cover it up !

I doubt it would lower their profit very much, but these big outfits
want to max out every penny they can. I bet a few dollars per unit
would rfi proof the cars. I would like to see consumers report provide
a article regarding this or at least include it in the annual car
review. If it's an illuminating problem then and only then will they do
something about it. The old saying goes, the squeeky wheel gets the
grease, it still holds true.

By the way, I would have to think the police vehicles are rfi proofed??

Buy American maybe huh...

So does that mean that if you were an unlicensed CBer with a 100W linear you would be ok
in a Toyota?
I think maybe whoever in Toyota doesn't really understand what they are saying. I think maybe a talk with someone else in Toyota is in order. I would almost guess (and it's only a guess) they're probably concerned with interference with a computer somewhere in the vehicle, but wouldn't the operating frequency be more of a concern that the power output?
I wonder what would happen if you were driving down the road in your Toyota and someone was right beside you with a 2 meter rig and transmitted. Would you car all of a sudden become erratic?

I have no direct experience with them but considering Radio Shack is
selling them, they've got to work to some extent. Considering that they
specifically mention that the clocks won't work in Newfoundland, because
of the half hour difference (surely it works, just not displaying local
time), and no disclaimer about how the clock may not work in all
locations, I suspect they generally do work in Canada.

It's a matter of distance from the transmitter, and as we've seen, location
may be crucial to whether the clocks work.

Michael

Colin,
Take a look at these coverage maps:
http://www.boulder.nist.gov/timefreq/stations/wwvbcoverage.htm
Looks to me like you should be able to get good signals up your way.

Here are two low-cost radios that will make a great project for someone who is looking for 2M and 440 capabilities.

I have one Icom IC28A (2M) and one IC48A (440) radio. The radios come with manuals/schematics, mike, and power cords. The 2M radio has a mobile bracket included.

These radios are in good working order but need some soap-and-water cleanup to make them look pretty. The IC48A has a one-inch rub mark on top that can easily be painted. The IC28A has a sticky on/off switch that should work fine with a little contact cleaner.

I tested these radios. They put out full power and both receive well.

Only $100.00 for both radios, plus shipping.

So it is better to buy a car or truck made by Ford or GM that is assembled in Canada or Mexico than to by a Toyota or Honda that is assembled in Ohio, Kentucky, or Tennessee with US made parts?

A little further research should reveal that as long as the transmitting antenna is located away from the on board computers, there is no issue. As an example, The transmitting antenna should not be installed on the front passenger side on the 2003 Toyota Camry (Assembled in Georgetown KY with US labor) since the main engine computer in located in that corner of the passenger compartment.

Good points, especially about the assembled in USA stuff.

One more issue, and just trying to be a smart alec here. If real metal was used...even that issue would be reduced.

Ya but, if the warranty is voided by using rf producing equipment then
no matter what you do to reduce the problem will do you no good. Your
warranty is still voided.

I would buy from a car company which supplies to the police deptments
and has sheilded computers with rfi protection, make them say that.
Otherwise I'll just buy old used vehicles. lets face the facts, the
new cars and trucks out there are $30k, $40k ect and to spend that much
and to be told that you can't use your little old ham radio for fear of
voiding the warranty or recking the dumb computer thingystuff then I
would tell them to stick it where the sun never shines.

I had been thinking of buying a Toyota van, but now I think I'll just
pass.

I'm in Canada, at 45 North 75 West and get a solid signal all day.
My clock has an indicator to show signal being received and it is
constantly receiving, but not using, the signal on it's little
loopstick.

I can also easily hear the 60kHz signal on both a long wire and an 18
foot whip, even now at 2300 UTC when the charts show the worst
propagation.

Dave

Same thing goes for Subaru.

My owners manual for my 2002 Forester
clearly says not to install any kind of a
transmitter within the car as it will foul-up
operation of the Emissions Computer and
the Electronic Antilock Braking System
and Keyless Entry system.

>these type of clocks and have never seen it happen on any of mine.

I don't think it is quite right so say that there is no error correction
on the WWVB signal. If you consider the fact that the time code transmitted
in any minute is always one minute advanced from the time code transmitted
in the previous minute, and one minute behind the time code transmitted in
the next minute, you can probably see that basing your guess at the current
time on the samples received over a number of consecutive minutes gives you
a substantial amount of redundancy with which to detect and eliminate bit
errors.

A clock which doesn't do error correction like this, but rather
unconditionally believes the time estimate from the most recent minute
it thinks it got, is, unfortunately, likely to spend long periods with an
incorrect time in the (normal) case that it is only getting signal from WWVB
for a small part of the day. Errors in decoding the signal are most likely
to occur just before the signal disappears altogether, so the most likely
time to see bit errors in the signal occurs just before the period when the
clock will have no way to determine that it made an error.

Here are some microphones and keys for sale. Prices do not include
shipping unless
specified.

Turner P-9D Dynamic Microphoneï¿½ï¿½ï¿½.$40
Dynamic Microphone made in Cedar Rapids, Iowa. This mike works and is in
excellent
condition.

Photos:
http://members.cox.net/radiostuff9/p9d2.gif
http://members.cox.net/radiostuff9/turner_dynamicmike.jpg

Astatic DN-500 Bullet Microphoneï¿½ï¿½ï¿½..$45
I am not sure if this is the original finish or not as I have never seen
one in gray. The unit is in very good condition with no major scrapes or
dings. It has been tested and sounds good. The chrome is nice and
un-pitted. The connector is a 3 prong Amphenol. This microphone fits
into my type "G" and "UGB" Astatic D-104 Microphone stands
Photos:
http://members.cox.net/radiostuff9/bulletmike.jpg
http://members.cox.net/radiostuff9/bulletmike2.jpg
http://members.cox.net/radiostuff9/connector.jpg

E.F. Johnson Base Station Microphoneï¿½ï¿½..$25 plus shipping
Good condition and working. Has a modular (telephone-type)connector.

Photos:
http://members.cox.net/radiostuff9/johnsonmike2.jpg

Vibroplex Black Base Original.....$80 plus shipping
The serial number is 134612 which dates it to 1944 and manufacture in
New York City. This bug needs a good cleaning. It is missing the weights
and one of the terminal screws. Replacements parts are available from
Vibroplex.

Photos:
http://members.cox.net/radiostuff9/vibroplex_original.jpg
http://members.cox.net/radiostuff9/vibroplex_original2.jpg

U.S. Army Signal Corps Flame Proof Key J-5-Aï¿½ï¿½ï¿½.$75 plus shipping
Flame Proof Key J-5-A made by L.S. Brach Mfg. of Newark, NJ. This is a
W.W.II key in very good condition.

Photos:
http://members.cox.net/radiostuff9/flameproofkey.jpg

http://members.cox.net/radiostuff9/flameproofkey2.jpg

I will ship overseas.

You can check my user ID "n7rk" on Eb*y
for a reference as to dealing with me.

Thanks for looking and 73,

Another note:

This low (60Khz) frequency is drastically
affected by local interference. For example,
some fluorescent lamps with electronic ballasts
in my office give off a huge amount of rf noise.
(It's so bad AM reception is impossible, and
even FM reception is comprimised.)

If I remember to turn off all these lamps when I
leave the office, my Atomix clock almost always
re-syncs overnight. If I don't, it never does!

Fluorescent lights, neon signs, sparking motors--
all of these make lots of low-frequency rf noise.

Luck, Dave

Dale, has nothing to do with US made. I'm a ham, I run ham radios in all my Toyotas with zero trouble. I see plenty of hams come in with their Toyotas and they seem to come in on their own power. I have NEVER seen a ham radio make a Toyota fail.

I've had one of these atomic alarm clocks for 6 months now and it has never sync'd with WWVB. I live in Wash DC. The clock is supposed to check for a signal every nite at midnite. Six months later, I'm still waiting for it to sync and for the little icon to display showing that it has done so.

I live in a normal house, not a lead-lined underground cavern. I can get XM satellite radio indoors from 26,000 miles up in space but not Colorado 2,000 miles away, even though WWVB's coverage maps suggest that the signal can be received as far away as Chile and West Africa at midnite eastern time. I've given up.

Have you tried relocating the receiver within your house? Also, rotate the clock 90 degrees from its current position. Sometimes even that can make a big difference. I have found that there are spots in my house (central NJ) where it simply can't get a strong enough signal, but there are others where it syncs every night. Maybe the sources of interference in your area are stronger for some reason.

Or maybe it's the gray men trying to jam Dubya's radios. !^D

I installed an Icom 2100h in my '01 Impreza RS, and can't discern any
problems while I'm transmitting, even on high power into the 5/8 wave
trunkmount antenna.

Generally the 60Khz WWVB signal is bet received right around dawn,
daylight reception is not common, and in my experience, I can rarely
get these to self set before about midnight .

If you want these clock to set reliably, it almost always requires
overnight.

Having sold several of this type of clock on eBay to our neighbors to
the north, the answer is yes. The range on the 60Khz signal is about
2000 miles from Ft. Collins Colorado, and that covers most of Canada.

I would think most are still fairly good, except for maybe Corvettes
and some Saturns...If the bulk of the car body is metal, it's going to
make a decent cage, except for what comes thru the windows.
>

They all are aware of the problem. But I don't think it's something
high on their list when designing the car. I think this applies to
many U.S cars also.

>
> I would like to think that my car would be safe from
> cruse control malfunction if I drive by someone
> operating a 2 way radio.

I would think it most certainly would be. The computer and most wiring
is pretty well shielded by the body if metal.
>
> I am starting to doubt the safety of all modern cars.
> Perhaps the car manufacturers should put in some shielded
> wiring and lower their profit margins in order to ensure

> wireless communication devices.

I don't think shielded wire would be a complete answer. Also ferrite
beads on every wire going in or out of the puter.
>
> Modern cars have a life threatening design flaw
> and they are trying to cover it up !

How are they covering it up if they are telling you outright that RF of any manly level is verboten operation in a new yota. They are telling you, watch your butt if you run rf. That is not a cover up. That is covering their butt. I really don't think the problem would be any more severe than any other similar car. They all can have problems. It's the nature of a partly solid state vehicle.
And the radio operation and the installation will have a huge effect on whether you have problems or not. A person running an antenna on the roof or trunk with a good ground underneath it would have much less problems than someone with a gutter mount, poor ground, and poor feedline decoupling. Or sitting in the passenger seat with a high power HT. Use common sense. The puter is 3 ft in front of your face, down by your feet. You "might" have a problem.
If you have RF problems in a car, the first thing to look at is the possibilty of common mode currents on the coax shield. The better the decoupling you have, the less likely you will be swamping the puter with rf. If I still had trouble, I'd make sure the puter was well grounded, and then I'd install ferrite beads on every lead going in and out of the box. Toyota will not do this. Heck, I had to show them how to check a wiring harness. All they wanted to do is quote me $1500 bucks for a new one without proving the old one was bad. It wasn't. I ohmed out every wire on the harness, and it didn't take me an hour I bet.
I'm sure the mechanics will vary per shop, but I doubt the ones I went to would be able to deal with it. They couldn't even fix the car. I ended having to do it myself. And in this case, I would fix the "rf" problem myself. I'm better able to do this than they are, being I fart with rf all the time. Or at least the ones I dealt with....MK

I do know what you mean about using that equipment, but I am not promoting a Spectrum Analyzer design on my website.....only the noise source. The noise source can be built for around 25 dollars. I have compared the flatness of response to my NoiseCom NC6112, and up to about 1.5GHz, the results are very similar.

Equivalent transmitters exist in a number of countries.
I own a german radio controlled alarm clock (normally controlled by
a transmitter in germany sending at 77.5KHz) and when I went to the US it continued
working without displaying that it lost the transmitter.

Greetings!

From: Ken <aeu96186_MENOWANTSPAM@yahoo.co.uk>
Message-ID: <b9av5sebp1@dennis.cc.strath.ac.uk>
Source record: 30574

Hello,

I am looking for several pieces of off the shelf equipment to perform RF transmission and reception across a table-top/room. The gear can therefore be very low power. The RF carrier frequency is flexible and a few hundred MHz would do although GHz would be nice - I guess if I track down a range of suitable equipment I will be able to trade Hz against cash!

I have seen quite a lot of expensive and complicated pieces of equipment that will do the simple tasks I require but I cannot justify the cost when all I really need is some sin/cos mixing and modulation. I have searched some online catalogues and spoken to reps from various companies with no success so far - surely these simple boxes must exist to buy!

Anyway, here is the list:

TX Box 1:
Inputs: 1 BNC input carrying an IF modulated signal
This box just needs to AM modulate the IF input to an RF frequency and possibly perform some sort of filtering to reject images?
Outputs: 1 - something suitable for feeding to an antenna...? not quite sure

RX Box 2:
Inputs: suitable connector coming from an antenna I guess
This box needs to demodulate the RF signal from box 1 and output it at some IF or baseband.
This box would need to do suitable filtering to demodulate with no problems.
Outputs: 1 BNC output.

TX Box 3:
Inputs: 2 BNC inputs carrying I and Q signals at baseband/IF
This box needs to mix the I/Q signals with cos/sin waves and add them together to produce an RF signal
Outputs: 1 - something suitable for feeding to an antenna

RX Box 4:
Inputs: suitable connector coming from an antenna
This box needs to mix the input with a cosine to get the I output and mix the input with a sine to get the Q output.
This box would also need to do suitable filtering to demodulate with no problems.
Outputs: 2 BNC outputs carrying I and Q.

Some of the boxes may not need filters as the ADCs/DACs I will be using can possibly do this job depending on the specs.

Any pointers towards suitable gear/places to buy it would be very much appreciated!

Thanks in advance for your time,

Ken

Glad this thread hasn't devolved into a shouting war....

When I first read the thread, I couldn't rmember the name of a book to
recommend. Now, I have it before me...

ARRL's latest, "Experimental Methods in RF Design" by Wes Hayward,
W7ZOI, Rick Campbell, KK7B and Bob Larkin, W7PUA may be what this
fellow wants.

The book is a replacement for the earlier Hayward book some have
mentioned already. It take the reader who has a basic working
knowledge of electronics to a more advanced level. There are practical
examples of all sorts of circuits and concepts. In fact, the book has
a full description of the design and building of a 2 meter SSB
trasceiver. It's not a "step-by-step' instruction manual but rather a
book which uses project to illustrate design concepts.

I think it's what the original poster is looking for. The price is a
little steep at $49.95 (with a CD-ROM full of docs and software) but
looks to be worth it. Get it at www.arrl.com.

A nonsense term frequently uttered by a comic strip character named Smokey
Stover. He was a fireman and drove a small fire fighting vehicle noted for
having two wheels and only one axle. No one I ever knew could define Foo and
I believe this mysterious quality is what led to that eras military pilots
naming the mysterious WWll
UFOs Foo Fighters.

I'm at this location also and did a little location experiment.
I have two of the clocks, with a 5 inch and a 3 inch(aprox) loopstick
antenna.

Both clocks must face west. They will not work otherwise. Also if I
place the clocks in a room where there is more construction material
to go through (the house is 40 yrs old and is brick and wood frame)
the signal will not get through ever.

In addition, the 5 inch will start to get the signal in the late
evenings, the 3 inch will not. The 3 inch only gets the signal after 1
AM.

The clock facing west is a bummer since it limits you to placing the
clock only on east or west walls which may not be the optinum place
for viewing the clock.

Also, here is a site that has plans for constructing an antenna. I'm
thinking of building one and replacing the loopstick antenna. Can
anyone who knows about antennas comment on this construction?

David,
I'm just 15 miles due north of you in Maryland, and I have no problem
with mine. My radio club made a group buy of about 12 clocks, and all
of them are working fine in the Laurel area.
You might have a defective clock.

Except for the tires, the Crown Victorias bought by the police are virtually identical to what you or I can buy, assuming we get the handling package (which is pretty nice, actually). What happens to the cars after purchase depends on the individual department.

When I was car shopping last August, the CV was my other choice, besides the Tacoma, because my main concern was towing. (Actually, I would've preferred a Toyota sedan, but they're not much good for towing, with front wheel drive, and other factors). The CV came out the loser when I began reading about their exploding gas tank trick, and how Ford really didn't have a solution yet.

But that would take an average of 30 seconds of my time. Also my clock might be in error by maybe as much as a second!

More to the point, I would have no excuse for the toy - which cost me $15 about 8 years ago and still keeps locked to WWVB.

Dave

Remember, these data are provided by lawyers to protect their employers from the clueless. Obviously, you could safely operate "killerwat" rigs in any of these vehicles so long as none of the RF got into the computer(s). Start by either ensuring that your antenna has a good ground plane or use one that doesn't require one (eg, J-pole) and a very good match (low SWR). You might also put some ferrite beads on the coax to avoid shield currents and on the power leads for your rig. If problems persist, try shielding the computer(s) with aluminum foil and putting ferrite beads on the I/O and power cables.

Alternatives: restore an antique auto or have a kit-car built for you. IIRC 1955 Chevys and Shelby Cobras had no RF problems and prolly cost less to drive than a new Toyota after depreciation is factored in.

That's prolly typical. Unfortunately there are unethical dealers who will tell you that such-n-such isn't covered by warranty because of something you did or didn't do, then they collect from BOTH you and the manufacturer.

Realistically, nothing will happen 'till it hits the courts.
Loss of warranty is the least of your worries. Wrongful death suit
'cause YOUR radio, INSTALLED IN VIOLATION OF CAR MAKER GUIDELINES,
caused some other proximate car to malfunction. Or maybe your car
malfunctioned
due to your radio and killed someone else. Even better, your car
malfunctioned
because os some taxi radio and killed someone. Try proving that it
wasn't your
radio!!

Of course, they'll sue the car manufacturer too, but that won't keep
legal fees from bankrupting you whether you win or lose.

Interesting times...

Not many people have radios capable of tuning WWV. Not even all hams
have HF equipment, and look at the other newsgroups this is posted to.
The little WWVB clocks are inexpensive and automatic.

Dave

I live in Springfield,VA. about 15 miles from Dave.I have two atomic wall clocks and an atomic wristwatch all three show precisely the exact same time.The only times they fail to lock up is when there is a thunderstorm within about 100 miles of me.I suspect you have a local interference problem Dave--maybe a light dimmer,they are horrible noise generators.Frank

Not true. The suspension on the Police package Crown Vic is tighter
(more firm). The electrical system is different also to accomodate the
additional load. There may be some other differences such as
transmissions, etc but I am not sure about that.

4459. New KDSP2 Advanced DSP Filter for the K2

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-07 19:58:45 UTC
From: Eric Swartz WA6HHQ - Elecraft <eric@elecraft.com>
Message-ID: <3EB96575.2010202@elecraft.com>
Source record: 30592
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

We've just released the KDSP2 advanced DSP for the K2. Below is the KDSP2 product description.

(We have also just released three transverters (6M, 2M and 220 MHz) that work with most HF rigs and an external band decoder box for controlling antenna switches and band pass filter boxes. Instead of putting everything in one huge email I'll be posting them separately to the list.)

73, Eric WA6HHQ
http://www.elecraft.com
============

The Elecraft KDSP2 brings versatile, high-performance digital signal processing (DSP) technology to the K2 and K2/100 transceivers. The KDSP2 unit, which is fully integrated with the K2, plugs directly into the Control board. It's also very easy to assemble, with no surface mount components to install. The DSP IC and related parts are pre-installed on a small plug-in module.

The KDSP2 provides up to four user-configurable filters in each mode (CW/SSB/data), complementing the K2's variable-bandwidth crystal filter. CW filter settings include center frequency and bandwidth, with "hard" and "soft" filter algorithms and bandwidths as narrow as 50 Hz. SSB filters provide programmable low and high cutoff frequencies. Four levels of noise reduction are available in CW and SSB modes, while SSB mode includes an automatic notch filter. The KDSP2 is unique in that noise reduction and auto notch parameters can be modified to suit the operator.

Filter modes and features can be quickly accessed via the K2's DISPLAY button, while parameters adjustment is accomplished using the DSP module's own menu system. In addition, the unit's firmware is flash-based and field upgradeable. The DSP code is open-source to encourage community involvement and education.

Like our KAF2 analog audio filter module, the KDSP2 includes a real time clock/calendar with its own backup battery. This feature is especially useful during field operation, eliminating the need for a separate clock for logging or contest use. Current drain of the KDSP2 can be reduced to approximately 10 mA by placing the audio filter subsystem in bypass mode.

The DSP code for the KDSP2 is open source, allowing advanced users to create their own DSP features for the K2. User supplied alternate DSP code will be posted in a special KDSP2 download page on the Elecraft web page. (DSP source code and K2 interface link module will be placed on this web site by 6/30/03.)

The KDSP2 is priced at $219. Additional information, pictures and orders can be placed via our web page at http://www.elecraft.com . KDSP2 units will be introduced and limited quantities will be available at the Dayton Hamvention,

May 16 ï¿½ 18th (Booth 196-7). Orders placed via our web page will begin shipping within two weeks following Dayton.

4460. New XV Transverters for the K2 and most HF rigs

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-07 19:59:17 UTC
From: Eric Swartz WA6HHQ - Elecraft <eric@elecraft.com>
Message-ID: <3EB96595.4040608@elecraft.com>
Source record: 30594
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Here is the transverter information. More pictures at http://www.elecraft.com

73, Eric WA6HHQ

Three state-of-the-art transverters are included in Elecraft's new XV Series: the XV50 (6 Meters), XV144 (2 Meters), and XV222 (222 MHz). The transverters can be used with nearly any transceiver that covers the 28 to 30 MHz frequency range, including Elecraft's high-performance K2 and K2/100.

The XV Series provides important benefits for the operator in both receive and transmit modes. On receive, the transverters combine a low receive noise figure (typically 0.8 dB) with a high dynamic range front end (+17 dBm mixer), ensuring exceptional weak-signal performance even in large-signal environments. Reliable overload detection is included at the IF port to protect the mixer. On transmit, the XV's 20-25 watts output will drive most high power linear amplifiers. A sequenced keying output is provided for external amplifiers, and a built-in wattmeter using a 10-segment LED bargraph provides fast power output monitoring. Provision is also made for an optional crystal oven to enhance frequency stability.

Single-port and dual-port IF connections allow use with almost any transceiver. IF transmit levels from 0 dBm to +39 dBm (1 milliWatt to 8 watts) can be accommodated, with a constant-impedance IF termination for consistent performance. Multiple transverters can be easily daisy chained to a single IF transceiver, providing multiband operation without cable rearrangement. A brightly illuminated label clearly identifies which transverter is selected.

The XV Series transverters are packaged in attractive, low-profile enclosures measuring only 1.2" (3 cm) tall, with styling that matches the Elecraft K2. The transverters are also well integrated with the K2 electrically, providing automatic band selection; independent, calibrated display of each transverter's operating frequency to 10 Hz; and front-panel power level control.

Like Elecraft's transceivers, the XV transverters are completely modular, simplifying construction and alignment. The professionally-written, fully illustrated manual will appeal to experienced as well as first-time builders. The kits are easy to assemble, featuring "no-wires" construction, and all surface-mount parts used in the kit (15 total) are pre-installed at the factory.

Price: $349.00
Availability:

Orders received now will begin shipping June 22nd. Additional information and on line ordering can be found at http://www.elecraft.com

4461. KRC2 Band Decoder For the K2 and most HF Rigs

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-07 19:59:36 UTC
From: Eric Swartz WA6HHQ - Elecraft <eric@elecraft.com>
Message-ID: <3EB965A8.6090203@elecraft.com>
Source record: 30593
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Here is the information on the KRC2 band decoder.
73, Eric WA6HHQ

The Elecraft KRC2 Band Decoder is a universal, programmable station control unit that can switch any combination of antennas, filters, amplifiers, or other equipment. It supports analog, digital, and RS232 control inputs, so it's compatible with transceivers from Icom (voltage level), Yaesu (BCD), and Kenwood (serial or BCD via logging program), as well as Elecraft's own K2 and K2/100.

The KRC2 includes decoded outputs for all HF bands (including WARC bands), three transverter bands, and general accessories. High-side (source) and low-side (sink) relay drivers are included. All signal lines are RF bypassed to eliminate RFI and noise pickup.

Individual driver outputs can be "wire-ORed" as with conventional decoders. However, the KRC2 also provides a PC-based command interface, allowing the user to configure the unit with simple text commands. New firmware can even be downloaded via the internet. The combination of these features makes the KRC2 uniquely suited to the user's present as well as future station control needs.

The KRC2 is fully integrated with Elecraft's transceivers, decoding band-change data via the company's AuxBus protocol. But other unique K2 features are also supported that can be enabled or disabled with jumpers inside the KRC2. The K2's ACC menu entry can be used to directly control the KRC2's accessory outputs. Four buttons on the top of the KRC2 can be used as "hot keys" for instant access to CW message buffers, fast switching of the rig's RXANT jack, or other functions. Finally, the KRC2 can act as a complete CW-feedback interface for the K2, allowing enhanced accessibility for operators with special user interface requirements.

Packaged in an attractive, compact enclosure that is only 1.2 x 3.5 x 5.5 inches (3 x 9 x 14 cm), the KRC2 is styled to match the K2. The easy-to-build kit uses Elecraft's "no-wires" construction and is suitable for first-time kit builders.

Price: $159.00

Availability:

Orders received now via phone or via the Elecraft web site, http://www.elecraft.com , will ship the week of June 22nd.

4462. Re: If it requires a license then you can't use it in a 2003 Toyota

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-07 20:12:08 UTC
From: raiar@bbs.galilei.com.nospam

My wife had a Toyota Corolla

If she parked in any of 4 different parking spots at her place of employment, all kinds of weird things would happen.

The windshield wipers would cycle, the radio change channels, the service lights come on, the doors lock and unlock by themselves, etc. The list goes on and on.

It was traced to a paging tower by using a mobile scanner and fox hunt techniques until we found that each time a particular company sent out a voice page her car would do something weird.

It was not only her Toyota, but several other cars that parked in any of those 4 parking spaces also had some weird things happen, many resulting in a dead battery by the end of the work day.

The FCC was notified of the problem, but it wan't until the FAA became involved that something was done and the paging company replaced some components. I have no idea how the FAA became involved, but apparently they were messing up something on the airplanes also.

I do a lot of driving and have unexplained things happen also when near large or high power transmitting or cellular towers. But have not had any problems from any of my ham gear and the car.

There is a section along interstate 24 about 2 miles off of interstate 57 where my vehicle dies momentarily. The first time this happened I though it was the car. The second time I thought it a rare coincidence. After the third time I started making a note of the milage from highway 57 when it occurred and it occurs at exactly the same point on the highway each and every time I pass through if I'm in the outside lane. The car seems unaffected if I'm in the inside lane.

I'm sure it was some type of radio interferrence that I had not yet found on my scanners when the problem finally quit happening. But now I have a new problem. The hatch pops open in roughly the same area, give or take about 2/10 of a mile. At least the engine doesn't die!

You make a splendid case supporting my contention that cars need less electronic body controls. Lots of cars (an increasing number since the early 1990's) have a "body ECU" that controls just the non engine & transmission gadgets.

==========

For the last 67 years I have been wondering about the meaning of "Foo".

The last time I recall seeing the word in print was in an American 1930's
comic paper.

In those ancient days pull-out comic papers were known as 'the funnies'.

The artist was Bill Holman.

One of his characters said in the balloon "All is not Foo that titters".

Replace Foo with Gold.

Replace titters with glitters.

A funny statement.

I am an Englishman. But what is Foo ?

Reg.

Andy,

Sorry it took so long to reply, almost given up hope on someone answering me and have only checked it tonight. Im glad to hear it can go that low though. Ive fancied one of these rigs for many years, they really are a classic. I use an IC706 as a workhorse rig and it '"does what it says on the tin", but an FT101ZD would be a nice addition to the shack, methinks.

many thanks,

John.

You mean that they are admitting that if say a police car (I don't think anyone is going to complain about them having a radio) or a truck with a CB keys up while driving by the BMW bike, and the brakes malfunction and the biker goes down, that they are at fault? How about radar?

This sounds like intelligent design on par with Audi's famous throttle control transistor debacle.

I'm not sure if an early 70's Hallicrafters SX-122A receiver is an antique or not, but it is only up to $77 on a government surplus web site along with a lot of 2-ways from governments all over the country.

I dont know if the handhelds are useful, but the web site is www.govdeals.com. Click on the GO DIRECTLY TO button on the top of the page then on the lower left select COMMUNICATIONS EQUIPMENT and BROWSE.

They also have everything from police cars to tractors. Kind of interesting.

From the jargon file: http://catb.org/esr/jargon/html/entry/foo.html

[...]

For, it seems, the word `foo' itself had an immediate prewar history in
comic strips and cartoons. The earliest documented uses were in the
"Smokey Stover" comic strip published from about 1930 to about 1952.
Bill Holman, the author of the strip, filled it with odd jokes and
personal contrivances, including other nonsense phrases such as "Notary
Sojac" and "1506 nix nix". The word "foo" frequently appeared on license
plates of cars, in nonsense sayings in the background of some frames
(such as "He who foos last foos best" or "Many smoke but foo men chew"),
and Holman had Smokey say "Where there's foo, there's fire".

According to the Warner Brothers Cartoon Companion Holman claimed to
have found the word "foo" on the bottom of a Chinese figurine. This is
plausible; Chinese statuettes often have apotropaic inscriptions, and
this one was almost certainly the Mandarin Chinese word `fu' (sometimes
transliterated `foo'), which can mean "happiness" or "prosperity" when
spoken with the rising tone (the lion-dog guardians flanking the steps
of many Chinese restaurants are properly called "fu dogs"). English
speakers' reception of Holman's `foo' nonsense word was undoubtedly
influenced by Yiddish `feh' and English `fooey' and `fool'.

Holman's strip featured a firetruck called the Foomobile that rode on
two wheels. The comic strip was tremendously popular in the late 1930s,
and legend has it that a manufacturer in Indiana even produced an
operable version of Holman's Foomobile. According to the Encyclopedia of
American Comics, `Foo' fever swept the U.S., finding its way into
popular songs and generating over 500 `Foo Clubs.' The fad left `foo'
references embedded in popular culture (including a couple of
appearances in Warner Brothers cartoons of 1938-39; notably in Robert
Clampett's "Daffy Doc" of 1938, in which a very early version of Daffy
Duck holds up a sign saying "SILENCE IS FOO!") When the fad faded, the
origin of "foo" was forgotten.

One place "foo" is known to have remained live is in the U.S. military during the WWII years. In 1944-45, the term `foo fighters' was in use by radar operators for the kind of mysterious or spurious trace that would later be called a UFO (the older term resurfaced in popular American usage in 1995 via the name of one of the better grunge-rock bands). Because informants connected the term directly to the Smokey Stover strip, the folk etymology that connects it to French "feu" (fire) can be gently dismissed.

The U.S. and British militaries frequently swapped slang terms during the war (see kluge and kludge for another important example) Period sources reported that `FOO' became a semi-legendary subject of WWII British-army graffiti more or less equivalent to the American Kilroy. Where British troops went, the graffito "FOO was here" or something similar showed up. Several slang dictionaries aver that FOO probably came from Forward Observation Officer, but this (like the contemporaneous "FUBAR") was probably a backronym . Forty years later, Paul Dickson's excellent book "Words" (Dell, 1982, ISBN 0-440-52260-7) traced "Foo" to an unspecified British naval magazine in 1946, quoting as follows: "Mr. Foo is a mysterious Second World War product, gifted with bitter omniscience and sarcasm."

Earlier versions of this entry suggested the possibility that hacker usage actually sprang from "FOO, Lampoons and Parody", the title of a comic book first issued in September 1958, a joint project of Charles and Robert Crumb. Though Robert Crumb (then in his mid-teens) later became one of the most important and influential artists in underground comics, this venture was hardly a success; indeed, the brothers later burned most of the existing copies in disgust. The title FOO was featured in large letters on the front cover. However, very few copies of this comic actually circulated, and students of Crumb's `oeuvre' have established that this title was a reference to the earlier Smokey Stover comics. The Crumbs may also have been influenced by a short-lived Canadian parody magazine named `Foo' published in 1951-52.

Actually, the FT-8900 is more like $390, and that's with a special coupon at
AES. The TMV7A has some other features and is focused towards the APRS user.

Thanks for the complete and delightful history of this interesting word.

I observed what might be a second entry point into the lexicon. After returning from military service at the time digital technology was first really expanding, I chuckled to find the digicats using "foo-bar" (foo with a line above it, meaning NOT foo) as a dummy variable. The evolution to foo as the popular name of an arbitrary subroutine seemed to have come from this. I've always assumed that "foo-bar" was from the popular GI expression FUBAR, meaning "f**ked up beyond all recognition", which dates from WWII. The digital folks I talked to had no idea where "foo-bar" had come from, and hadn't heard the GI expression.

I have for sale a very nice Elecraft K2 (ser number 2516) with 100 watt module in excellent condition that I built and aligned. It has all the modules including 160 meters, noise blanker, audio filter and real time clock, SSB with Heil hand mic. This one is a little unique in that the tuning knob is one from an ICOM 706 and the unit has a 706 carrying handle on the side. The most current firmware that Elecraft has out is installed along with the mods that bring it completely up to date and compatible with Rev B circuit boards. All manuals for the rig and all the modules are included. I am asking $1200 payable by cashiers check or money order. I will ship anywhere in the U. S. Please respond to Dk7zh@aol.com for mailing address.

73,
Duane. K7ZH.

Dunno about England, but here it probably varies according to the
neighborhood you are in. I hear some people use it to mean about the
same as your examples.
IE: "Saiz woman, youzz a damn foo."
I hear that usage quite often.

A "foo fighter" is WW2 and later fighter pilot slang for a UFO.

Hello Bill,

Yes, it should work fine. Check my WEB page for an HP141A system with
141T plug-ins:

http://jvgavila.com/testeq.htm

Only thing is that you don't have an spectrum analyzer grid on the
141A/B display but I adjusted display to the standard grid and it is
accurate enough.

Best regards,

JOSE

Ranger owners, where/how did you mount your radio? I have a Ft-8900r
that has the option for remote mounting head fwiw. Mounting under
dash doesn't seem too ergonomic since I drive with the seat all the
way back and I don't see any great positions for remoting the head.

The truck is a 91 Xlt extended cab.

Thanks, Wes, KC8SPR

i took the ash tray out and remounted the air bag control under the dash,
and mounted the siren and one radio there, then i put the other radio on the
overhead roof with a few small holes in the headliner, and VERY short
screws......you have to kinda look up to see the overhead but it is able to
be turned toward the driver, so it works real good.....
oh yea, and i have a mini dualband mounted above the rear view mirror with
the radar detector.

I recently installed a 2 meter mobile rig in a 2003 Toyota
Avalon. So far, I haven't had any problems.
The rig is hidden in the compartment under the center armrest.
Power wiring is run directly to the battery main lugs with
a fuse in each wire (positive and negative) as provided by the
rig manufacturer (Yaesu).
The antenna (1/4 wave spike) is mounted on the rear trunk lid
lip, with the coax run down from the armrest compartment under
the carpet, along the drivers side of the car, up into the
trunk.
I tested the installation by parking the car with the engine
running and transmitting, starting with the lowest power
setting and working up to the highest power at different frequencies.
I stayed out of the car until I was sure that the air bags
would not activate. Then I got into the car and tested with
the doors closed.
After passing these tests, I drove the care on a street with no
traffic and retested. After gaining some confidence that the
impact air bags would not deploy and the brakes were working OK,
I took the car out into traffic. Several months have passed
and, so far, no problems encountered.
I also know that Toyota vehicles are used around the word by
police with various types of two-way radios installed. I
would advise that the use of power directly from the battery
is critical to the installation.
Good Luck with your installation,
Bill N0LAJ

Hambone?,

I had the opportunity to visit Hamvention for a few years now, and anything this large will have it's share of problems.
I left the hotel early, parked right across of Hara in one of the pay lots, and did not have that far to walk.
When I did make a purchase, I flagged down one of the people driving around in those Golf Carts,
and got a ride back to my vehicle.

This year, at the last minute, myself and some friends decided it would be nice to have a Flea Market space.
We have a lot of items on our "Want List", and would welcome to opportunity to sell some items we have to generate funds.
Last year, we noticed there were quite a few open spaces, and with the economy the way it is this year maybe someone out there
wants to sell there space for what they have into it.
So.. I am still looking.. Hamvention has not answered any of my email inquires yet and it has been over a week.

If anyone has an available space, and want to sell it, please send a note to my address below.

k4kal at arrl dot net

Thanks,
Keith

Most likely circumstance is that your clock computer got 'glitched' and reseting it cured the glitch.

I think you're supposed to bargain.

Problem is, some of the asking prices are so outrageous that instead of bargaining, I want to laugh. I've seen new prices asked. How do we approach that with a straight face?

I once had to teach an Extra how to make a QSO! But I did it without making him feel stupid. I didn't bite his head off, and now he is a fine upstanding Ham.

BTW, a third of a watt is .33333333 watts. This means that it is 333 milliwatts rounded off. We wouldn't want him running around with the wrong answer.

> If I seem to a jerk, I apologize, but I am very sad for our hobby.

Another sad part of the hobby is the people who feel compelled to give people a full ration when they ask a "stupid question". Should this person know this? Undoubtably.I give him credit for asking for confirmation.

>>milliwatts?

And the way you find the power Andy, is to take the power, in this case 1/3 watt.

1/3 watt equals .33333333 watts.

Lets convert to the same units here

1 watt equals 1000 milliwatts - milli means thousandths

so we take 1000 milliwatts and multiply it by .33333333

The answer is 333.3 miliwatts (rounded)

I have a pair of brand new recessed flush mount carrying handles.
These are a pull out and lift up type. These would be good if your
into homebrewing chassis's for receivers, transmitters or amplifiers
etc. It based similar to the carring handles on a Kenwood TL-922a
amplifier. I have quite a few more if you need more than 1 pair. I
will sell a pair for $5 plus shipping. Click on the link below to get
an idea on what they look like........If you have any questios
email.....WZ1U Steve / Lakeville, Ma.

I was answering to another post in which Scott wrote:

>>> You can't be serious, right? This is a joke? Where is the technical part of
>>> the question?
>>>
>>> A third (.3 or 1/3) of a watt (1000 milliwatts) is 300 milliwatts. You

>>>
>>> If I seem to a jerk, I apologize, but I am very sad for our hobby.
>>> Especially when someone with an amateur callsign catagorizes this as a
>>> technical question.

And after digging though the messages,(and what you pointed out to me)
I see that the original poster wrote that his low power setting was .3
watts.

My response was that .3 watts is not 1/3 of a watt, as Scott appeared
to think.

>> 1/3 watt equals .33333333 watts.
>>
>> Lets convert to the same units here
>>
>> 1 watt equals 1000 milliwatts - milli means thousandths

So Toyota is saying 'no commercial 2-way radios' (i.e. business radios), and no cell phones either? Remember that cell phones do require a license and are on the carrier's FCC license grant as the mobiles licensed with the carrier's fixed cellular sites.

Yes, I agree. I really do miss Art. I started listning to the program a year ago when I had paracarditis which kept me up most of the night and I would find comfort listning to Art on my R8A. I don't miss the paracarditis but do miss Art Bell, he had some good guests. One I remember from Areceibo which was very interesting and kept my mind off the pain for the whole program.

Thanks for the memories Art Bell.

This radio is in good working order and cosmetically a 9/10. Comes with
original manual and wall charger.
Asking $175.00 plus shipping.

Hi Philip

Dig this.

I had my alternator go out the day before yesterday. Had a new one put in last night. The mechanic disconnected the battery of my car without using a backup battery in the cigarette lighter.
This reset the computer and all sorts of things back to factory default.
More importantly, the EGR valve was reset somehow and the 'service engine soon' light, that has been on for over a year, after several trips to the service center finally went out and has stayed out.

I had to get an emissions test today for new tags for the car. The inspection station rather than hooking up the tailpipe sniffer, plugged a cord somewhere under the dash. The car passed with flying colors.
Prior to the alternator going out, I was told I needed to replace the EGR valve and have some spyder thing in the carburetor replaced.
Running the same diagnostics on the engine this afternoon showed everything to be A-OK.

Wonder if it's built in, pre-programmed error codes to make one have parts replaced that don't need it?
I know RCA TVs used to have a Thermistor in them, connected in such a way they could not easily be bypassed. The only purpose was the Thermistor is like a candle, it only lasts so long and goes out.
I figure it was either a ploy to keep RCA repairmen in business or to sell more TVs, other manufacturers did not have them.

If one only knew how to replace a few pincushion caps (that dry out) in monitors and TVs, they would run for years without any other problems.

I believe you mean the TMD700A is aimed at the APRS user? The
TMV7A is more a voice user radio similar to the TM-G707.

I have disconnected the battery in my Jeep several times to
clear out trouble codes and other goofyisms. Seems heavy
doses of HF at idle change the programmed settings and
it takes too long to reset by itself. I have also disconnected
sensors to see what they are by what code comes up. That
requires a reset! YMMV.

Hi Bruce

I had a car that the gas pedal would stick to the floor.
The manufacturer said it was totally impossible.
After several other people had the same problem and it appeared in the newspapers, they began looking into it.
Two causes were determined - the first was simple, the factory installed and affixed rubber pad under the gas pedal on the carpeted floor would somehow move forward and catch under the edge of the pedal, least common and only in the hot summer months.
Most common was the cable from the carburettor to the gas pedal would fray on vehicles with certain options and snag.

But like the fellow with the Crown Vic, rather than an electrical problem, many Crown Vic's had a problem with a broken motor mount.
If you hit the accelerator to hard, the motor would lift, pulling on the throttle linkage, causing them to accelerate more quickly.
But if you were parked, like up against a small curb and the car could not move forward, the engine would lift right away and pull the throttle to wide open while doing so.

Ironically, we had a Crown Vic run through the front of the Creve Coeur, Missouri 63141 post office only a few months ago. Problem, broken motor mount caused the vehicle to accelerate over the curb, over the sidewalk over the planter box and into the post office.
The driver said all they did was put the car in gear and it took off like a skyrocket, even with their foot planted firmly on the brake pedal.
At first it too was deemed as driver error. Everyone thought she had her foot on the accelerator, thinking it was the brake. But the police could clearly see the skid marks from the braked wheels, vs the burned rubber marks from the driving wheel.

That stupid thermistor was in the degaussing circuit. It's claim to fame
was that it would allow the magnetic field decay slowly. When the thing
died, it usually burned off the plastic covering, unbonded the two
leads, and arced harmlessly. Lots of noise, some smoke, and a guaranteed
service call. With the thermistor missing, the degaussing coil would

remain active longer and cause wavy. colored lines on the screen. My cure in the field was to pick out all the pieces and twist the two leads together. Even though this removed the degausing feature, it made the TV work. And degausing every time you turn on the TV is usually a waste of time.

CTC-30, CTC-31, etc., had them, but I think by the time they came out with the CTC-100 they had eliminated the thermistor...

Paracarditis is one of my afflictions.... a secondary symptom of
polymyositis. Lasix and digoxin do a good job of keeping excess water
from accumulating within the paracardium and minimize the arrhythmias,
respectively. Art filled in for George a couple of weeks ago. He'll
still host once in a while. Stay tuned! LOL

Some years back, I bought a new Ford Ranger (1984). One (of many
many) bulletin that came out concerned erratic spark knocking during
night time driving and/or when the wipers were running. Seems the
EEC-IV fuel system (an electronic controlled 2 bbl carburetor at the
time) was getting erroneous signals from the TFI module in the
distributor and errant EGR signals. Well, as Ford built it orginally,
the wiring harnasses for the distributor and EGR sensor were bundled
together and looped part way around the ... alternator. You guessed
it. Induced magnetic field especially when the alternator was
producing a lot of amps. Took Ford a year or two to figure that one
out. Solution was to reroute the harnass some 6-10" away and secure
with zip ties.

4547. Icom 2410H powers-up transmitting

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-09 02:38:48 UTC
From: fmmck@aol.com
Message-ID: <20030508223848.26854.00000060@mb-m03.aol.com>
Source record: 30479

When I had a problem with a newer radio, I dug out the old IC-2410H to use as a spare. I just happened to notice that it was transmitting for a short time after turning it on.

I mentioned this to a friend who still uses the same radio, and he had the same problem. He suggested disconnecting the microphone, which stopped the radio from transmitting.

The HM-56A microphone appears to be where the problem is. It is a very sophisticated microphone that even has its own CPU! I suspect a capacitor is involved, since the length of time until it stops transmitting seems to depend on how long since the radio was last used. Unfortunately, the IC-2410H service manual does not include anything about the HM-56A microphone.

Has anyone solved this problem with the HM-56A microphone? Thanks for any suggestions.

Do you find enough activity on 6 & 10 FM to make the inclusion of
those bands worthwhile, especially with the hassle of the extra
antenna(s), which are quite a bit bigger than vhf/uhf whip(s)? The rig
seems a strange critter to me -- but that's just me :-)

The Viking Valiant II is a self-contained radio frequency transmitter designed for amateur service. CW/AM/SSB. CW-200w, AM-150w, SSB-150w PEP. 1.8 Mhz-29.7Mhz. 120v. operation. Serial #1448

This unit is in excellent working order but needs some paint work around the front of the unit. Complete manual included. I am not an expert on this equipment, but I know that this one works. Unit weighs 83 pounds so it must be shipped by truck. I would prefer local pickup in the Los Angeles area, but I will arrange for truck shipping and professional boxing using foam packing. Buyer pays all boxing/shipping/insurance/tracking.

Asking $300.00 plus shipping.

I seem to remember that was normal for it to transmit for something
less that 1/4 second. I had one of the first in the country, since I
used to work at Icom, I beta tested that radio. I know the one I had
did the same thing. It was never enough to even kerchunk a repeater. I
am not sure how much RF power was output during that pulse.

You have any options in it like the UT-66 and UT-67? I remember a mod
for the UT-66 but it was for a whine on the received signal. You might
pull those and reconnect the mic to see if they have any effect. Or
connect the mic up to another Icom about anything that uses the 8-pin
connector will work, and see if it does the same thing.

Icom Support should be able to help you out with a HM-56 / HM-56A
schematic. There is an electrolytic cap that can short or maybe leak
which will cause the PTT line to be pulled low thus the radio
transmitting. I had seen that cap go bad a few times and cause a rig
to stay in transmit.

I'm working on installing a FT-100D head and GPSII+ with some
parts from Pro Fit

Using a Vehicle Specific Mount, order it by make, model, year
and a EZ-Swivel to extend it forward and away from the glove
box. Using a J-Adapter and Extension Bracket to off-set and
place the GPS under the head. Parts seem soidly made and
the mount I got for my Explorer Sport Trac fits really good,
I'm tempted to file down the plastic where the bracket fits
between the trim and the dash for a more finished perfect fit.

Mounting the radio in the back behind the seats then.

I personally found that in my area, the 2 meter repeaters are so abundant, that there's really no need to have anything other than 2m for FM work, unless you're just interested in FM simplex on the other bands. I can't speak for 10m, but 6m and 70cm is pretty quiet around here. One major flaw with this radio is the fact that there is only one antenna jack. At a minimum, there should be a seperate 10m jack, and a seperate 6m jack would be nice too. The selection of triband 6m/2m/70cm antennas is limited as it is with maybe 3 or 4 options, let alone a quadband antenna. I think only Diamond and Comet make quadband antennas and with the cost of the antenna ($110) and the mount (around $60 for a decent mount!), you're adding around $170 to the cost of the rig. Now you're at $560 to get on the air with this rig and with shipping, you could be spending close to $600! Geez, you're approaching the cost of a used FT-100D at this point. I made a mistake buying this radio when it came out and promptly sold it (at a loss) and bought an FT-1500.

What would make it better?

Seperate jacks for 2m/70cm and 6m and 10m.
Make the 4th band an optional band, chosen between 10m, 1.25m or 23cm. This would make it more appealing for op's like me, who are limited to 6m and above.
Computer programming (I heard this is on it's way)
Ability to use all bands on both VFO's (on one of the VFO's you can only use 2m/70cm

Just my $.02 worth!

Couldn't fit three up front in the bucket seats if I tried, but
with the seats in the back I can seat 5 comfortably.

I just really couldn't bring myself to put in anymore holes than
necessary, I did have to drill 2 for the profit mount but they are
behind the trim so they are not visible, should I wish to sell this
in another 10 years I still won't have any visible holes.

The whole thing extends out about 3-4" the mount I ordered is
fairly low profile. It does not extend down too far, I think
if it was a bench I could still seat 3 in the front.

My only real complaint so far on the explorer sport trac is the
fiber-glass pickup bed, makes a really poor ground source.
Working on installing some ground straps around the upper edge
under the trim and attaching them to the main cab and frame for
a better grounding system. Plan on fabing a bracket soon to use
as a mounting plate for a hamstick above the power point in the
back, using the tonneau cover brackets as the mounting point, still
no visible extra holes on the outside / inside

I received a more reasonable response from Toyota on this issue.
Looks like the same letter I received in 1994.
I am happy again ...

--
KC6SOZ

Response (Sara)05/09/2003 09:06 AM Thank you for contacting Toyota Motor Sales, U.S.A., Inc.

We appreciate the opportunity to address your inquiry.

The installation of a mobile two-way radio system in your vehicle could affect electronic systems such as multiport fuel injection system/sequential multiport fuel injection system, cruise control system, anti-lock brake system, SRS (supplemental restraint system) air bag system and seat belt pretensioner system.

Vehicle electronic components could be damaged, and/or the proper and safe operation of the vehicle might be compromised if, for example, any of the following situations (and potentially others) existed:

* The transceiver is not "type-accepted."

* The power and/or antenna cables radiate RF current

* Routing of the power and/or antenna cables results in inductive or capacitive coupling

* Transmitter, feedline and/or antenna inefficiencies result in an unacceptable level of RF radiation exposure to the ECM's

* The standing wave ratio is unacceptably high

* The antenna ground plane is inadequate

Installation of a 2-way radio in Toyota vehicles should not present issues under the following conditions:

* The transceiver must be type-accepted by the FCC, and not modified in any way

* Maximum output power complies with FCC regulations (100 watts)

* All installation and operating instructions provided by Toyota and the equipment manufacturer must be followed closely

* The antenna must be installed as far away as possible from all
vehicle electronic control modules (ECM) or other onboard
computer/sensors

* The antenna cabling must be routed no closer than 20 cm (7-7/8
inches) to any ECM or other onboard computers/sensors

* Antenna and power cabling must not be routed along side or in
conjunction with the vehicle's wire harness
o It is always preferable to cross vehicle harness at right
angles when possible
o Antenna and antenna cabling should be properly adjusted to
obtain the lowest possible SWR (standing wave radio)

Disclaimer: The basic installation guidelines provided may be of
assistance to you. Although they may not fully answer all your
specific requests, Toyota must take reasonable precautions to limit
our potential legal liability, because the full range of possible
variables noted earlier could never be fully anticipated. Also, more
detailed information that would provide the operational details of
Toyota's electronic system is considered proprietary.

We do not recommend modifying our vehicles from their original factory
specifications. Modifications could affect the vehicle's performance,
safety or durability, and may violate government regulations. In
addition, damage or performance problems resulting from the
modification may not be covered under warranty.

It must be emphasized that, under the terms of Toyota's new vehicle
warranty, damage caused by RF energy from a higher power mobile radio
is specifically excluded from coverage because it is not the result of
faulty materials or workmanship. Accordingly, the owner assumes all
such responsibility.

We recommend that you contact your local Toyota dealership for any
additional clarification regarding the installation process that you
may need.

Your email is documented at our National Headquarters under file
#200305090234. If we can be of further assistance, please feel free to
contact us.

National Customer Relations

* All installation and operating instructions provided by Toyota and the equipment manufacturer must be followed closely

* The antenna must be installed as far away as possible from all vehicle electronic control modules (ECM) or other onboard computer/sensors

* The antenna cabling must be routed no closer than 20 cm (7-7/8
inches) to any ECM or other onboard computers/sensors

* Antenna and power cabling must not be routed along side or in
conjunction with the vehicle's wire harness
o It is always preferable to cross vehicle harness at right
angles when possible
o Antenna and antenna cabling should be properly adjusted to
obtain the lowest possible SWR (standing wave radio)

Disclaimer: The basic installation guidelines provided may be of
assistance to you. Although they may not fully answer all your
specific requests, Toyota must take reasonable precautions to limit
our potential legal liability, because the full range of possible
variables noted earlier could never be fully anticipated. Also, more
detailed information that would provide the operational details of
Toyota's electronic system is considered proprietary.

We do not recommend modifying our vehicles from their original factory
specifications. Modifications could affect the vehicle's performance,
safety or durability, and may violate government regulations. In
addition, damage or performance problems resulting from the
modification may not be covered under warranty.

It must be emphasized that, under the terms of Toyota's new vehicle
warranty, damage caused by RF energy from a higher power mobile radio
is specifically excluded from coverage because it is not the result of
faulty materials or workmanship. Accordingly, the owner assumes all
such responsibility.

We recommend that you contact your local Toyota dealership for any
additional clarification regarding the installation process that you
may need.

Your email is documented at our National Headquarters under file
#200305090234. If we can be of further assistance, please feel free to
contact us.

4563. Ferritronics PC17 Pl board info needed

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-09 18:09:20 UTC
From: Charles Rader <kc5dgc@centurytel.net>
Message-ID: <j4Sua.192$115.238898@feed2.centurytel.net>
Source record: 30495

I have several Ferritronics PL boards model number PC17 and I need some
information on. Does any one know anything about these boards.
What the jumpers do and how to set the tones on it.

Thanks in advance.

Down here, most FMers are on 144/440 -- I imagine that's true of most
of the country, too.

> One major flaw with this radio is
>the fact that there is only one antenna jack.

One solution might be an outboard antenna switch that handles 3 or 4
antennas, but that could turn into a rat's nest of wire on a mobile
platform. A single jack for 10 meters through 440 mhz does seem
strange.

I think it would be a better radio if they dropped 10 meters and
included 220 mhz -- that's a band that needs beefing up or we may lose
it again.

I have a nice SB-220 for sale. Serial No. 19712, including manual.
This amp has not been powered up since I shut my station down in 1989.
At that time it would operate at full output. I modified the fan
(original was noisy) with a whisper fan. I still have the original fan
if you want to restore to original. Cosmetically I would say the unit
is 9/10. Wired for 220V.
$550 + shipping from Zip 45429.

Agreed, and an addition: say someone else designs the vhf radio, and the design has no flaws. Never mind designing it, just plain BUILDING it can be difficult when you're new. Construction practices that won't hurt at HF can ruin a VHF/UHF circuit.

Another suggestion: go to hamfests and look for an old 2 meter
mobile rig that needs repair. If it has the schematic and block
diagram, buy it. You'll be able to learn a lot just repairing
it. Perhaps even better - buy an old crystal controlled
scanner at a hamfest. I've seen them go for $5.00. They cover
portions of VHF and UHF, and at that price you could afford
to "put bugs" on the receiver (i.e. purposely break it) and then
learn what that does to the performance, how to diagnose
the problem, and what the individual circuit does.

Damn.
Now my Oregon Scientific "radio controlled" clock is receiving a
signal that sets it one hour ahead of my actual EDT.
I changed it manually and will wait to see what it does the next time
it tries to find WWV.
Anyone else have theirs be one hour ahead via the autoset?

It's right in Toyota and Subaru Owner's Manuals in "black-and-white".

Says all extended warranties will be VOID if a "RF Emitter"
of greater than *10 watts output* is installed in their vehicles.
Better save that old low RF power vintage Yaesu FT-723R
Memorizer! (it's rated at 10 Watts)

It said -extended- warranties, not the standard, from-the-factory warranty.

Extended warranties are a waste of money anyhow.

The exact language will be interesting to read.

My Icom 706 MKIIg is installed in my vehicle[s][Ford Ranger or Chrysler LHS]. But it is NOT an 'RF Emitter' IN the vehicle! ... The RF emitter is the antenna and that is located outside the vehicle!!

What is the exact wording? Read it like a lawyer!!

Icom 02AT and Icom 04AT handhelds for sale. These units both come with the
BC-35 drop-in charger, BP-3, BP-4 Alkaline cell pack and BP7 battery packs.
Also included are the wall chargers that are hardly used.
The 02AT will make a nice one-night project to fix an open squelch problem.
The 04AT works perfectly.
These units are in "good" shape, not museum pieces. Both come with original
manuals and schematics.

A great deal at only $150.00 for all this plus shipping/insurance/tracking.
Actual shipping costs will be determined by your location.

<< I seem to remember that was normal for it to transmit for something less that 1/4 second. >>

Gary-

Mine can take up to a minute or so, worst case. I keep it on UHF at minimum power. I wait for the local repeater to beep after I turn it on, and identify (There is very little traffic on that repeater.) From your description of 1/4 second keying being normal, it sounds like there is a capacitor that has to charge up before the P-T-T line goes high. Mine must have a leaky capacitor or a series resistor that has gone high in value.

It seems to take longer if temperature is high and the radio has been turned off for several hours. If I turn it off and back on again after it has unkeyed, there is no perceptable keying.

I looked for my old IC-22U but couldn't find it. The IC-706 has a different connector, so I'll have to find some other way to check the microphone.

Thanks for the prompt reply.

Source record: 30418
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

The ICOM AH-4 automatic antenna tuner is designed to work with select ICOM transceivers including the 706 MkII, 746, 756. It provides reliable matching of frequencies from 3.5 to 54 MHz when using a wire of at least 23 feet (7 m) in length. It can also be used for matching 7 to 54 MHz when used with the optional ICOM AH-2b antenna element. The built-in 8-bit microprocessor chooses the lower SWR condition from more than 1,040,000 different LC (coil/capacitance) combinations. The LC combinations of 45 previously-used frequencies are automatically memorized by the AH-4. Once a frequency is memorized, the AH-4 tunes on that frequency is less than one second. $210 plus shipping.

Source record: 30419
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

The MB-V-A Nye Viking tuner will handle power in excess of 3000 watts PEP sideband and CW with a continuous rating of 1500 watts into loads between 40 and 2000 ohms impedance with an SWR reading below 1.1:1. A 3KW trifilar wound broadband balun provides balanced output to twin lead feeders 100 to 1000 ohms resistance and unbalanced output impedance down to 20 ohms at the Coax "A" and "B" outputs. The unit features 2 1/4" tuning knobs with 4" dials; a 1 to 25 vernier readout over 360 degrees on the variable inductor tuning plus 360 degree readout on the variable capacitor. The extra heavy gauge aluminum cabinet provides adequate shielding. The input connector from the transmitter or linear amplifier is a standard SO-239 UHF connector and the output terminals are high voltage porcelain feed-thrus and SO239 Delrin UHF coax connectors for 50 or 72 ohm coaxial cables. Frequency range is 3.5 to 30 MHz with limited coverage of the 1.8-2.0 band segment The size is 14 1/2" wide, 6 3/4 high and 12 1/4" deep. Shipping weight is 20 pounds. This unit has a few scratches on the top of the cabinet, so I cannot call it excellent, but scratches don't hurt the performance of this very high quality, high power tuner. See http://www.nyeviking.com/ for more info on this great tuner. I am asking $650.00 plus packaging/shipping.

Six position, 50 ohm version. Switch may be panel-mounted. All connectors are located on the rear of the housing and are parallel to the shaft of the switch. All connecting cables may be laced together without the use of right-angle adapters. This switch cannot be operated accidentally, but must be operated by intentional sequential movement. The knob must be grasped, pulled out, rotated, and pushed in to make contact. This switch is in excellent condition and has never been hot switched. Cost new $370.00. Asking $150.00 plus packing/shipping/insurance/tracking.

A minute or so is far worse than I had seen. I to suspect the mic. The
HM-56 mic will work on most of the current HF products, the older VHF
UHF mobiles from the 27 series up to the IC-3220. I probably forgot
one or mere here.
There are a couple of SMT electrolytic on the HM-56 circuit board. One
is attached to the PTT line , seems to me it was C3, and if it goes
bad the cap will cause the radio to transmit. sorry i can't be closer
to the part number, I don't have a schematic for the HM-56.

I had the same problem with my '97 Sable. I routed the power leads through the drain hole in the floor under the driver's seat. If you look under the car, you will see a rubber plug almost directly under the driver's seat. I pulled that plug, punched a hole in it with an awl, and pulled the wires through the hole. I sealed the hole with some RTV sealant inside and out and replaced it. The wires are routed to the battery through some of that flexible corrugated tubing for protection against chafing. If you look, you will see a channel under the car that the brake lines are recessed in--plenty of extra room for the wires too. Once inside, I routed the wires under the carpet to the threshold strip under the door and then up to the dash behind the kick panel. I had enough room to run a 10 ga. power and ground lead as well as some 16 ga. zip cord for my siren speaker. Hope this helps. 73 de Bob W8IJG

hey mike
i to have a mercury sable
and i went thru the rubber skirt around the steering column to the battery
if you dont like that i would suggest going to your local audio shop or
CB shop that does installs and have them do it usually costs around $20
to have them do it but well worth it since they know all the little
hidding places to run wires

>USE FA Moron!!!

Actually, he's selling it, not auctioning it off... he actually thinks someone will pay $300 for it when you can get a brand new one right now from AES for $270, and they're throwing in the MH34B4B speaker mic (normally sells for $31)! I suppose this is because he thinks the added cell phone band increases it's value?

To top it off, he's publically announcing that it violates US law in regards to it's ability to transmit outside of ham/CAP/MARS frequencies and it's ability to receive cellular frequencies. I guess he intends for it to be sold outside of the US? ;)

I noticed that the trim pots in my MFJ meter have the sweep contact
and the left contact (CW=0 ohms, CCW= 10K ohms) shorted together.

What is the purpose of doing this (as opposed to just using the sweep
and the right contact)?

If you use only the wiper and one fixed contact, there is the
possibility of an intermittent open circuit, either during adjustment
or with the pot just sitting there.

By connecting the other fixed terminal to the wiper, you eliminate the
possibility of an open circuit.

The clock didn't update overnight. It has a little radio tower icon
in the display, and if it finds WWV and sets the time "waves" appear
near the tower. No "waves" were there this morning.
I looked at it later in the day and the clock had updated to the correct
EDT by finding WWV.

Just a standard earphone should suffice. You can get those at Radio
Shack. I however prefer a monaural headset or a Walkman-style headset
with a monaural adapter attached to it for my personal scanner listening.

I live in the Kitchener, Ontario area and have 2 MFJ atomic clocks.
One is on a south west wall near the ground and works flawlessly. The
other is in my shack on the 2nd floor and if placed on top on my main
computer or on a west wall, it won't lock. If placed in my window on
the north side of the building - works great. Only other signifigant
problem I've had was 2 weeks before DST switchover the one in my shack
went to DST and displayed Pacific time. Next day it was normal. Why? I
don't know- maybe harry potter was playing wizard again??

Just my 1/2 cent worth

I asked Toyota this question directly by email:
"I would like to know if there are any restrictions (output power, antenna gain and/or location, frequency band, modulation type, etc.) on the installation of 2-way radio equipment in the 2003/2004 model year vehicles, and if so, what those restrictions are."

Here is their response, edited only to remove HTML tags.

Subject
Inquiry regarding limitations of 2-way radio equipment installed in 2003/2004 Toyota vehicles

Discussion Thread

Response (Sharon) 05/09/2003 03:42 PM
Thank you for contacting Toyota Motor Sales, U.S.A., Inc. We appreciate the opportunity to address your inquiry.

The installation of a mobile two-way radio system in any Toyota vehicle could affect electronic systems such as multiport fuel injection system/sequential multiport fuel injection system, cruise control system, anti-lock brake system, SRS (supplemental restraint system) air bag system and seat belt pretensioner system.

Vehicle electronic components could be damaged, and/or the proper and safe operation of the vehicle might be compromised if, for example, any of the following situations (and potentially others) existed:

The transceiver is not "type-accepted."

The power and/or antenna cables radiate RF current

Routing of the power and/or antenna cables results in inductive or capacitive coupling

Transmitter, feedline and/or antenna inefficiencies result in an unacceptable level of RF radiation exposure to the ECM's

The standing wave ratio is unacceptably high

The antenna ground plane is inadequate

Installation of a 2-way radio in Toyota vehicles should not present issues under the following conditions:

The transceiver must be type-accepted by the FCC, and not modified in any way

Maximum output power complies with FCC regulations (100 watts)

All installation and operating instructions provided by Toyota and the equipment manufacturer must be followed closely

The antenna must be installed as far away as possible from all vehicle electronic control modules (ECM) or other onboard computer/sensors

The antenna cabling must be routed no closer than 20 cm (7-7/8 inches) to any ECM or other onboard computers/sensors

Antenna and power cabling must not be routed along side or in conjunction with the vehicle's wire harness

It is always preferable to cross vehicle harness at right angles when possible

Antenna and antenna cabling should be properly adjusted to obtain the lowest possible SWR (standing wave radio)

Disclaimer: The basic installation guidelines provided may be of assistance to you. Although they may not fully answer all your specific requests, Toyota must take reasonable precautions to limit our potential legal liability, because the full range of possible variables noted earlier could never be fully anticipated. Also, more detailed information that would provide the operational details of Toyota's electronic system is considered proprietary.
It must be emphasized that, under the terms of Toyota's new vehicle warranty, damage caused by RF energy from a higher power mobile radio is specifically excluded from coverage because it is not the result of faulty materials or workmanship. Accordingly, the owner assumes all such responsibility.

We recommend that you contact your local Toyota dealership for any additional clarification regarding the installation process that you may need.

Hello all. I am considering which dualband mobile to buy and I'm leaning towards the Kenwood TM-G707A. I owned one of these a while back and loved it, but I've seen this new Yaesu FT-90R and it looks nice, very compact remote mount head, which is something I'd like, but I've read some bad reviews on eham.net.

Can anyone give me their experiences? What disturbs me is what I've read about the RX going south when the rig heats up.

4627. Motorola GTX & Maxtrac-LS - Help !

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-11 04:34:55 UTC
From: p34901@hotmail.com
Message-ID: <694df9e0.0305102034.23bec334@posting.google.com>
Source record: 30259

Recently, I came across a couple of Motorola mobile radios(900 mHz. MaxTrac-LS and GTX)from someone (who also said both radios are working) from a Tow Truck company. They are nice and appear to be in good shape, and when I switch the power on, it goes through a self-test and finally I see two green digits on the LED display. Everything seems to be working fine except I don't hear anything through the internal speaker no matter what I do with any of the controls, not even a hiss as if squelch is not breaking. This is my very first encounter with a trunked radio but I am beginning to think that it could be due to trunked system programming rather than mal-functioning. I was quite excited to hear that these 900 Mhz radios can be programmed for Amateur band, and I would just love to try them out. Anyone who is familiar with these radios knows whether and how they can be programmed for Amateur band? What about the reason for the absolute absence of sound? Thanks in advance for any reply.

> Can anyone give me their experiences? What disturbs me is what I've read about
> the RX going south when the rig heats up.

I have had my FT-90R since December 2002. I have only used it as a base rig... it has been wonderful. I have never put it in my car, though. Seems that most of the problems that I've read about concerning this rig have been associated with its mobile use.

The FT-90R is a TINY rig-- my VX-5R handi-talkie is barely smaller than it-- so, if you plan to get the FT-90R and use it in your car, be SURE and allow lots of space for air circulation. The fan, which has variable speeds, is not especially quiet and due to the small size and good power output of the rig, it's pretty much going all the time when you are transmitting. But it's not overly annoying, as far as I'm concerned.

The FT-90R is more expensive than the TM-G707A (I'm using Gigaparts.com's pricing as a baseline) but the FT-90R has a better receive range, which may be important if you are interested in any scanning capability (I use my FT-90R as a scanner as well as a transceiver). This is one of the reasons I chose this rig. But to be honest, the main reason I chose this rig over several others I was considering was the fact that it is so small. I needed a small VHF/UHF rig that would fit into a small space. The FT-90R fit that bill perfectly.

I can tell you that as far as the FT-90R goes, I have had absolutely zero problems with it. Again, I have never put it in my car, though, so I cannot be a judge of its mobile performance.

Source record: 30262

The receive audio from the FT-100 is normally "full spectrum".

One way of eliminating the PL tone from the speaker audio is to turn DSP bandpass filter ON and filter out everything below about 240 Hz or so (whatever the standard increment is on the hi/lo pass filter) while working FM repeaters.

Rick N6CY

Source record: 30263

Hello Peter

Both radios can go amateur, the GTX with a software only modification, the Maxtrac needs software, front end filters changed as well as modification to the VCO.

Checkout the archives on the Yahoo AZ902 board and Batlabs sites - http://groups.yahoo.com/group/AR902Mhz, http://batlabs.com.

The Maxtrac is the better of the two radios IMHO, of course requires more effort to move to the amateur band. Fully modified it will Rx and Tx 902-928Mhz. The GTX will do repeater 25Mhz splits and simplex at the top end of the band only.

well i am not sure with the RigBlaster Pro
but with my RigBlaster NOMIC you unhook your speakers from the computer
and plug into the line out on the RB then you plug the audio cable they
gave you from the line in from the RB to the line out of the computer
if you need any help you can go to www.westmountainradio.com and get a
couple of the manual and such there
good luck

4639. Gen Coverage VS. Transceiver

Newsgroup: rec.radio.amateur.equipment

If I were to buy a good General Coverage Receiver such as an Icom R-7000, can I expect to have receive performance on the Ham frequencies, as good as a good Ham Transceiver does? Perhaps there are trade offs in a General Coverage Receiver when tuning in the Ham Bands? I don't know and am seeking opinions on this matter. Thank you in advance.
Cordially,
west

Gernerally speaking the requirements are the same but with one
exception.

Hams are not assigned frequencies but are free to operate anywhere
within a band where we have privileges. Consequently, interference is
a given and the ham optimized receiver or transceiver will have more
interference fighting capability than the usual general coverage
receiver.

It has to do with bandwidth and selectivity. It is easier to get
narrow bandwidth (i.e. high selectivity) with a low intermediate
frequency (IF). This is because bandwidth is a percentage of the
center frequency of the filter.

For applications which require very narrow bandwidth, such as morse
code reception, a low IF is desirable. But because of image response
problems, you need higher-frequency IF stages before the low-frequency
stage, i.e. triple conversion.

It would all depend on the receiver. If you get a low end transceiver and
for the same money get a general coverage receiver , the receiver may be
beter. You will have to give specific modle numbers of each for a fair
compairison.

I depends entirely on the performance criteria for the receiver. I
was trying to give a simplified, general answer to a basic question.

I will be happy to expound at length if you wish, but that was not
appropriate to the OP's question.

It all depends on the specific radios. They all vary to quality. Ham
and general coverage. Being the R-7000 is "I believe" an upper end
radio, it's probably as good on HF as many of the ham rigs. Depends on
of they put more design work into the HF or VHF/UHF end of it. I would
think it's quite usable anywhere.
A radio is a radio.
They make no distinction on the content listened to. I'd like to have
an R-7000, if it's the one I'm thinking of. But being I'm cheap, I
just buy the "ham" rigs. They are good enough for "gov" work as a SWL
radio. I purchase with the ham band requirements in mind #1, being
thats more important to me. I use my IC-706mk2g as my "all band"
radio. Much cheaper than an R-7000. And yes, some general coverage
radios would be greatly inferior to the avg "ham rig". But the R-7000
is not your "average" gen cov radio. I think it's supposed to be
pretty good. Assumming again, that I am thinking of the correct radio.

Source record: 30292

Hi West,
The main differences between the ham transceivers and the
dedicated receivers are in the area of I.F. gain, so the system will
generally be higher. Will the NF be similar? Probably. Will the IMD
performance be better on the transceiver. As far as HF equipment, probably
not, since just about all of the newer transceivers are of an upconversion
design, with suboctave banspass filters in the front end, so the aperture is
about the same. On VHF/UHF transceivers, the CAN be a different story, if
the front end is bandwidth limited on the 2M/70CM bands, as is the case with
such rigs as the Icom 275A, or the Kenwood TR751A. That's the reason that I
use these two rigs for my weak signal work, vs. the "all in one" type of
rig. Still, this may not be a issue, because narrowband preamps for those
ranges are still available.
As far as price setting quality, that is not necessarily the case. The
kenwood TS570 has one of the best front ends, using a Quad JFET ring mixer;
this gives a high IP3. This is the same type of mixer that is used in the
Yaesu FT1000, the Racal 6790, and the AOR7030, although the 7030 is using a
packaged Siliconix device. I don't know why Kenwood doesn't play up this
point.....maybe they don't want this to cut into their upper tier
sales.
I hope that this post, along with the other posts, sheds some light on this
subject.

Pete

One more thing that I forgot to mention, I had an Icom R7100 and a 275A, and on the 2M band, weak signal reception was better on the 275A.

I've responded to Travis Jordan's post by inserting comments into the
Toyota response. I don't see any problems assuming a good engineering
installation. My comments are based on Engineering management
principles, good installation practice, and commercially available
transceivers.

If the reader still has reservations [s]he is advised to review Toyota's
response with a contract attorney.

> (and potentially others) existed:
>
> The transceiver is not "type-accepted."

COMMENT: ICOM, Yaesu, Kenwood, Alinco, etc. are ALL type accepted. So,
NO PROBLEM here.

>
> The power and/or antenna cables radiate RF current

COMMENT: Power in Twisted #12 AWG from battery is suitable and ferrites
on coax should deal with this 'concern'. A proper installation is
required. So, NO PROBLEM here.

>
> Routing of the power and/or antenna cables results in inductive or capacitive
> coupling

COMMENT: A proper installation is required. So, NO PROBLEM here.

>
> Transmitter, feedline and/or antenna inefficiencies result in an unacceptable level
> of RF radiation exposure to the ECM's

COMMENT: This puts burden an manufacturer to define what is acceptable
level of RF Exposure [field intensity as a function of frequency, AKA a
susceptibility plot] as a function of frequency. This is a hole big
enough to drive 10 KW through!!

>
> The standing wave ratio is unacceptably high

COMMENT: High VSWR does not contribute to radiated field intensity or to
stray currents. This requires a burden of proof on the manufacturer to
prove the assertion.

>
> The antenna ground plane is inadequate

COMMENT: With today's plastic cars this may be a point to address. I ran
100 watts on HF in a Plastic Saturn SL-1 with adequate ground plane. The
trunk hood was bonded to the frame with multiple 1 inch wide straps.
This is a red herring issue. Good installation will eliminate this concern.

>
> Installation of a 2-way radio in Toyota vehicles should not present issues under the
> following conditions:
>
> The transceiver must be type-accepted by the FCC, and not modified in any way

COMMENT: AGREE

>
> Maximum output power complies with FCC regulations (100 watts)

COMMENT: DISAGREE. MAXIMUM POWER OUTPUT IS 1000 WATTS IAW FCC REGULATIONS.

Note: In the preparation of contract language the party composing the
language is responsible for accuracy in requirements, errors, possible
multiple interpretations, misinterpretations, or any interpretation that
favors the non-composing party. This claim is not binding due to errors
of fact.

>
> All installation and operating instructions provided by Toyota and the equipment
> manufacturer must be followed closely

COMMENT: FINE. Ask Toyota to provide installation instructions for all
past, present and future 2 way radios. I'm sure they will love doing
that! <grin>. They made the assertion so they are bound to provide the
instructions!

>
> The antenna must be installed as far away as possible from all vehicle electronic
> control modules (ECM) or other onboard computer/sensors

COMMENT: REASONABLE.

>
> The antenna cabling must be routed no closer than 20 cm (7-7/8 inches) to any ECM or
> other onboard computers/sensors
>
COMMENT: REASONABLE. Since ECM components are generally mounted in or
around the engine/exhaust subsystems and antennas are typically mounted
at or near the rear of the vehicle this should be a non issue.

> Antenna and power cabling must not be routed along side or in conjunction with the
> vehicle's wire harness

COMMENT: REASONABLE

>
> It is always preferable to cross vehicle harness at right angles when possible
>
COMMENT: REASONABLE

> Antenna and antenna cabling should be properly adjusted to obtain the lowest
> possible SWR (standing wave radio)
>
RED HERRING. BUT GOOD INSTALLATION PRACTICE ANYWAY.

> Disclaimer: The basic installation guidelines provided may be of assistance to you.
> Although they may not fully answer all your specific requests, Toyota must take
> reasonable precautions to limit our potential legal liability, because the full

CONCLUSION

I don't see anything that prohibits the proper installation of a typical
HF/VHF/UHF commercial radio in Toyota vehicles.

If you have further concerns take the Toyota text and ARRL Mobile Radio
booklet to your attorney for an opinion.

Coax mantle currents caused by high VSWR?

Obviously something controversial ....

I own a Toyota too.
The best car you can get for money.
Not a single repair necessary for 7 (seven) years now.

HF equipment restrictions apply for ALL car manufacturers,
read the small print.

Helmut, High VSWR is not a problem of circulating or coupled currents.
That's a simple fact.

My center fed doublet on 75 meters has a VSWR of more than 30:1 with
negligible currents on the feed system. [open wire feeders and a tuner].

But you didn't discuss *anything* appropriate to the OP's
question.

There was *nothing* in your statement which suggested three
conversions were useful or needed, or not. What you said about
selectivity was basically true (except that today we can get
sufficient selectivity at an IF that is also high enough to
avoid image proplems, at least for HF receivers).

A third conversion is useful if (and only necessary if) you want
some advantage other than those you discussed (image rejection
and high selectivity), such as perhaps bandpass tuning.

(Regardless, what is the point of bringing up a message from
a few weeks ago and rehashing the entire discussion?)

4674. 50 watt Kenwood TM-261 2m VHF Mobile Transceiver - $100

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-12 04:12:08 UTC
From: RamDog <RamDog@comcast.net>
Message-ID: <85OcnSJLkqz8giKjXTWcpA@comcast.com>
Source record: 30356

50 watt Kenwood TM-261 2m VHF Transceiver with Backlit DTMF microphone.
$100 COD from Salem, OR
blissninny at comcast.net
503-371-3131

Details:

High RF power output
Rugged construction (MIL-STD)
61 multi-function memory channels plus 1 call channel
Memory Name (MN) function with 6-digit alphanumeric display
DTSS selective calling
Multi-scan capability
Dual menu system
Multi-function microphone with backlit keys

High RF power output
The TM-261A puts out an impressive 50 watts. Also has mid- and low-power settings.

Meets MIL-STD requirements
Strict MIL-STD environmental standards for vibration (MIL-STD 810C) and physical shock (MIL-STD 810D) are fully complied with.

61 multi-function memory channels plus 1 call channel
For quick access, essential data -- transmit and receive frequencies, frequency step, tone frequency, etc. -- can be stored in the 62 memory channels. All channels can store transmit and receive frequencies independently for odd split repeaters.

Memory Name (MN) function
All 62 channels can be identified alphanumerically (max. 6 characters) instead of by frequency. This is particularly convenient for repeaters and club channels. It is also possible to switch to a channel number display.

DTSS selective calling
Built-in DTSS (Dual-Tone Squelch System) allows DTMF access: the squelch is opened only when a specific 3-digit code has been received. Using the wildcard asterisk, group calling is also possible.

Multi-scan capability
Choose from several scan modes: full band scan, programmable band scan, and memory scan with programmable memory channel lock-out. There are also 2 scan stop modes: TO (time-operated) and CO (carrier-operated).

Dual menu system
Two menu modes -- A and B -- offer full control over such settings as

frequency step and the time-out timer, when required.

DTMF memory function
Up to ten 15-digit DTMF codes with ID can be stored for auto-dial and autopatch use. Redial is also provided.

Built-in CTCSS tone encoder and optional decoder
The decoder enables the setting of different tones for transmit and receive.

Backlit DTMF microphone
This multi-function microphone has backlit keys to facilitate operation in low-light situations.

Other Features:
Tone scan
Wireless cloning function
Auto repeater offset
Repeater reverse switch
Lock function
Busy channel lockout
Auto power-off
Time-out timer

Dimensions (W x H x D)
140 x 40 x 160.5 mm (5.51 x 1.57 x 6.31 in.)

Anyone tell me what's required to operate a GP300 in VOX mode
I know you activate it in the RSS but what hardware do I need?
Is it as simple as a Mic and ear piece or is there some other Vox specific equipment I need?

Help appreciate Phil......

4676. Re: Need an advice on FT847

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-12 10:38:59 UTC
From: Brenda Ann <brendad@shinbiro.com>
Message-ID: <b9nrko$5eu$1@news1.kornet.net>
Source record: 30358

Having owned an 847, I can say that they make a fine receiver..

They have four different antenna connections. One is for HF (which covers 100 KHz through and beyond 30 MHz), one for 50 MHz (and all around there), one for 144 MHz (which also covers FM BCB, aircraft, and VHF public service bands) and one for 430 MHz (which covers all UHF that the radio receives) there are simple mods available online for this radio that allow you to receive a lot more as well (and TX on MARS/CAP if you're licensed for it).

Receiver specs outside the ham bands are pretty good... though the BCB and, presumably, LW are attenuated somewhat due to the sensitivity of the receiver. One caveat is, if you are program listening in the AM mode, leave the noise blanker OFF... as it causes considerable audio distortion. Other than that, I was very very happy with mine. I did finally sell the radio, and bought myself a nice FT-100, because of lack of space in my shack and even more lack of space in my vehicle.

I had a 1989 Camry, it was no doubt the best car I ever owned. The
engine ran like a wrist watch, you could put a cup of coffee on top of
the running engine and barely see a ripple and get this, I bought it
used from Hertz with 27000 miles already on it and after a couple of
years of ownership and a thousands more miles on it I noticed a little
paint peeling off on the passenger door. Someone told me to take it to
a Toyota dealer and have them look at it so I did and they fixed it
..... no charge. I almost fell over.

After all is said and done, when I get ready to buy and if I decide on a
model I would not let that legal disclaimer stop me from installing a
radio in MY car just as I have done in my 94 Dodge Caravan and have had
no problems.

A friend recently gave me a Comet GP-9 antenna that he has has lying around for years. It was hit by lightning and my friend just got it replaced through insurance.
Other than the obvious damage of the top section on the antenna being destroyed what other possible damage may occured. Is there any way to check the rest of the antenna to see if it works before going to the trouble and expense of replacing the top section??

Look forward to all your replys and comments,

Tom S

Hmm, the R-7000, in one of my older AES catalogs, is listed as a 25
mhz to 2 ghz scanning receiver, priced at about $1200. So as far as
ham bands are concerned, we're talking 10 meters and up. I'm not sure
how well ham transceivers "hear" on the higher bands -- I've only
listened on FM on 144/440. It probably depends on whether you're
talking about a general hf/vhf/uhf transceiver like the 706, vs. one
dedicated to the vhf/uhf bands. I'd guess the R-7000 would be quite
competitive. You can probably find some reviews on the net, if you do
a search.

The XYL has used one mobile for over a year. It's not a bad rig but frankly we're not impressed. You trade off a lot of useability for small size. Unlike the FT-7100 and other rigs, the display can only be read at minimal off-center angles the rig only does one band at a time - like a VX-5 in a bigger package but without 6M. Flexibility sucks because it's so hard to program mobile. In fact, if I had it to do over I'd buy a VX-5 and an external amp because, like the VX, small size = limited controls = limited mobile operability. If you buy the programming SW/cable, set up the repeaters and freq's you use, then ONLY use those you'll love it; otherwise otherwise. Need to use a different repeater? No problem. Just pull into the next rest stop, break out your laptop, and reprogram the radio (c;. YMMV

73 K3DWW

We never had a problem with overheating but it doesn't work when cold - no display and scratchy transmit audio til temp gets over 50 degrees.

4682. FS: Collins 30S-1 HF Amplifier

The 30S-1 R-F Linear Amplifier consists of a one-stage linear amplifier and the necessary power supplies. It is capable of maximum legal input power in the amateur bands between 3.5 and 29.7 MHz. It operates in either CW or SSB service with any exciter (such as KWM-1, KWM-2 or 32-S1, etc.) capable of 80 watts PEP output. In addition, the amplifier may be operated outside the amateur bands at any frequency between 3.4 and 30 MHz by retuning its input circuits. Serial number 11590. This amplifier is of museum quality. There are no scratches on the unit anywhere. The face is perfect except for some rub wear on the on/off buttons. The unit is in perfect working order and uses the 4CX1000A tube. This amp will come with the original Collins manual. The pages are still crisp and the book has no pencil marks other than the serial number on the front cover. The manual is dated March 15, 1965. Amp will be crated for shipping. Shipping/insurance/crating will be paid by the customer. Amplifier weight is 160 pounds. 30 5/8 in. high, 17 in. wide, 18-3/4 deep (overall dimensions) Crating for shipment will add 10 to 25 pounds to its shipping weight. Local pickup in Southern California (Los Angeles area) is preferred. Asking $2500.00 plus shipping.

This amp consists of four push-pull amplifiers (8 2SC2652 power transistors) ensuring stable 1kW output power. A built-in fully automatic antenna tuner provides instant antenna matching conditions during QSY's. Full break-in operation.

Separate RF deck and control head. For use with Icom radios only. RF deck has casters for easy movement. Control head is in perfect condition, minor scuffs and scratches on the RF deck. RF deck is floor-mounted, so this is usually not a cosmetic consideration.

Asking $3,000 plus boxing/shipping.

From: Bill <"bill at kinex dot net">
Message-ID: <3ec010eb_3@corp.newsgroups.com>
Source record: 30368

Hello to the group,

I have a Radio Shack HTX-202. I'll try to describe what is happening.

If you turn the squelch up enough to close the receiver it will never open back up. You can see the signal strength meter show a strong signal but the audio never breaks the squelch.

If I turn the squelch down and turn the radio off an back on so I can hear the static of the squelch being open, the audio will come through just fine.

I know I can just leave my squelch open but I sure don't want to listen to static all the time.

Any ideas?

Thanks in advance,
Bill

I'd guess that you have the Tone Squelch feature turned on, in order
to work a local repeater which requires a proper tone, and that you've
put the radio into a mode where it both sends the tone (on transmit)
and requires the tone on receive (to open the squelch).

There are some repeaters which require a tone, but don't send the tone
on their output. If you're trying to use a repeater of this sort, you
must enable the transmit tone, but disable the requirement for the
receive tone.

Try the following: press FM followed by F+M-SET to open up the
configuration menu. Press the scroll-up or scroll-down keys until you
reach the "rc" menu (receive CTCSS). Turn the TUNE control until the
display reads "oFF", then press PTT to save the setting.

I had this very same problem with one of the little 200-milliwatt
HTX-200 HTs that Radio Shack closed out recently. The "TS"
tone-squelch control is a two-way (on/off) control, unlike the
three-way setting on my VX-5, and it took me a while to find the
(undocumented) "off" setting for the actual receive-tone frequency.

Thanks for the reply.

I do not have the Tone squelch turned on. I am talking about the regular squelch.

If I turn the radio on with the squelch all the way down (so you hear static) the radio will work fine, rx and tx. If I turn the squelch up (just enough to stop the static) the radio goes quiet like it should. Now if I try turning the squelch back down, even all the way, it will not make any noise at all. No static. Nothing. I can trasmit and bring up a repeater but no audio. If I quickly turn the radio off and on (with the squelch down) I can hear the repeater I just keyed.

Perhaps it is just a minor problem. The squelch pot may have a bad spot in
it. Try spraying some cleaning solution into it.

Hi Guys;
I have for Sale:
A drake R-4B receiver.There is some spotting on the Chassis but most have some because of the copper plating they used. Everything affects it. It seems to be all correct & has the proper feet, the Calibrator, metering, Agc and Notch are working. The Front panel is Excellent with NO worn Lettering. The cabinet is Good to Very-good.
It is in Playing condx but may need alignment a tube, watever:-)
Price is a very fair $175 + UPS.

Hi All;
I have for Sale:
Removed from the back of a DX-100 Transmitter, this Johnson Coupler #250-37 was used in conjunction with Johnson Tuners & SWR meters which required this for the meter to work.
So if you have lost yours or never got one with your meter, now is your chance to complete the set :-)
It is in clean condition with some scratches around the outside from being mounted.
Not able to test it though, no meter!
These are super hard to find by themselves!

Hi All;
I have for Sale:
This Commercial cabinet contains a Variable transformer which is made by OHMITE, thier model VT8N-2. I believe it to be rated at 110VAC @ 8 AMPS, Great for bringing up those older radios & electronic items that have not been used in years.
I tested it on a Digital VOM & it goes from about 6vac to about 120vac.
It has a nice long AC cord with an AC recepticle on the front panel.
I have only tested this quickly as stated, nothing else done except for a "wipe-down" :-)
Every restorer needs one of these. Made in the USA by a great manufacturer, not in China!
New one made in the USA are very costly indeed!

Hi All;
I have for sale:
You may have a Hallicrafters SR-150/160 that you would like to take mobile, correct?
Well here is the PS-150-12 mobile power supply for them. I guess it can be used with any rig needing these voltages(see pic)
I coul'nt test it but I did look inside and everything looks fine, no signs of burn-outs or "unfriendly" repairs by angry beavers :-)
It is in good+ physical condition & appears complete!
I have seen very few of these in the past 30 years so I don't know much about them, other then I know they are hard to find, whether to use or collect!
A nice addition to any Hallicrafters collection.

Hmm.... how then do I produce currents on the outer
shield of a coax?
Say, we want to do that for experimental reasons.
What is the mechanism.
Unsymmetry at the antenna side?

(Actually I was reluctant to install an FT100 in my Toyota.
I know I must have very good grounding etc).

So, if I want to have a radiating coax feed line,
how do I proceed.
Build an EH or CFA antenna on the roof of my car?

Source record: 30390

I'm looking for a QRP rig, and was wondering if the MFJ 90XX series still has a drift problem. All the posts about it here on the Usenet seem to drop off in 1998. Does that mean that MFJ finally got a handle on the problem in 1998? If so, is there any way I can tell if a used 9020 was built pre- or post-1998?

TNX,

Rob Henderson

Source record: 30393

Well, I know that's not true because I have programmed mine a couple of times. What you can't do is program the CTCSS tones. After you program the frequencies, you have to go back and manually program the tones. In spite of that limitation, it still is a huge help to be able to program frequencies, mode, splits, filters, etc. in the 107 memories. It's pretty fast to put the tones in, and a lot of the channels won't need them anyway. For example, I monitor a lot of AM aircraft frequencies.

I found a message in one of the 706 reflectors that said all you have to do to use the OPC-478 is put a stereo to mono adapter on the end of the cable. It is also interesting that HRO lists the OPC-478 as an option under the 706 even though the 478 doesn't show the 706 as a compatible radio. I was hoping to find someone who has actually done it.

Feed a monopole *without* any ground plane and the shield will become the other half of a dipole. Often happens when a vertical monopole is installed on a vehicle without a 1/4 wavelength of metal on at least 4 sides below it.

Mis-feeding the antenna will do it: feeding a balanced antenna with an
unbalanced transmission line will do it: feeding a balanced antenna with
a transmission line at less than 90 degree relative angle will do it, etc.

>
> (Actually I was reluctant to install an FT100 in my Toyota.

I'm not qualified to discuss EH or CFA antennas. From my reading of the
newsgroups I understand that they may be better than the MFJ 250.

Hi All;
I have for sale a 1943 Weston 774-5 US Army Signal Corps ANALYZER. It checks just about everything, tubes, ohms, HV, Caps, etc!
It has some sort of Tube adapters which plug into the top so you can check each pin status with the built-in metering? I've never seen this before.
I have replaced the line cord & it seems to check the older style tubes just fine. It uses two dry cell batteries inside for the VOM, Both are original Burgess :-), one is a "D" cell, the other is a 4.5V which you can easily replace with 3 type "D" cells. Plenty of room in the case for this!
May need some cleaning, adjustments, etc!
Price is $75 + UPS.

Looking (for a friend of course) for a 50A1 "ballast tube" for a multi band tube receiver.

I see net dealers with them with some crazy prices.

If you have one you'd care to part with, I'd like to try and buy it at a reasonable price. Please drop me a reply using the Email address below (cut and paste), not the one that appears in the reply header.

I'd also be willing to trade you for some type of tube you might need/want. I plan on giving the 50A1 away to someone, so even a working used one would work.

I've also read about solid state replacements for the 50A1. If you can provide me a refernce article on the web, I'll just make him one. I hate to reinvent the wheel.

thanks much for reading this

cheers

Hi all, Available at Dayton spaces 1943-1944:

For Sale:

Harvey Wells station including:

R-9A receiver works but has had some mods cosmetically done to it

T-90 transmitters (two of them) - not tested

APS-90 power supply - not tested

Bandmaster Z MATCH - not tested

FS-1 Fixed station speaker works good

No connecting cable for power supply but I do have the Cinch Jones
connectors

Original manuals for the R-9A & T-90 reprints for the other pieces

At Dayton flea market spaces 1943-1944

Equipment in fair to good or better condition not beat up or filthy.

Manual reprints available on all pieces also.

Need to clear out some radios - so I can buy some new ones ;>)

Kenwood TS-520S Station: $275
Includes: TS-520S Trasceiver
VFO-520 Remote VFO
One spare set of balanced finals.
Yeasu Dynamic Desk Mike
Add-on Digital Display (Not DG-5)
Has User and Service Manuals.
This transceiver works very well and still transmits a good 100 watts into
a dummy load as measured by a Bird 43 watt meter.
The TS-520S is one of the jeeps of the ham radio world - it just keeps on
going & going & going. . . Great starter setup

Icom IC-Z1A 2M/70CM HT with Maha 45 Watt Docking Station/Amplifier: $250
Includes: Two BP-173X, 9.6 volt/1000Mah Nickle-MetalHydride batteries -
these are the ones that don't develop memories.
Has all User Manuals
HT transmits 5 watts with charged batteries on 2 meters and 4.5 watts on
70CM.
Amplifier transmits 45 watts on 2 meters and 30 watts on 70cm.

The 'Z1A is the step- father if the IC-W32. It has the head and cable that
will detach from the radio and become a remote speaker-mike.

All equipment is offered "As-is" to protect myself from golden screwdrivers.

So tell me, how are BMW NA, Toyota and Subaru going to tell if the
damage was caused by RF or lightning?

This is what happens when someone is desperately trying to be a smart ass and it blows up in their face. Even if the prices weren't listed (WHICH THEY WERE), a simple email to the guy would have sufficed, but instead Dan decided to put on a dog and pony show in an attempt to show everyone else how smart he is/was.

I am getting out of HF.

IC-746 with Kenwood MC-60 Microphone. $800.00 or will
consider best offer. Radio has occasional problem with
the display backlight. This is a know problem with the radio
and can be repaired. I have never considered it much of
a problem.

Also for sale, Cushcraft MB5A mini beam. $200.00

Images can be seen here:

http://bellsouthpwp.net/k/d/kd5eis/equipimg.htm

I prefer not to ship. If I have to ship it will have to be pre-paid.
I will be in Dallas in June for Hamcom if I have not sold it
by then.

Hey, it's not only possible, it's *likely* that'll you'll make lots of QRP QSOs! QRP presents challenges to any ham tired of push-button contacts (literally true in the case of Echolink). There are even 'Fox Hunts' organized for the winter and summer months (a 'Fox Hunt' has one or two stations on 40 meters (winter) or 20 meters (summer) somewhere in the US and Canada and the object is to work 'em. Sounds easy, but the din of competing stations during the brief time the Foxes are on and battling the ionosphere takes time and talent. If you're around an area with a bunch of QRPers who have formed a club, I understand the meetings are loads of fun; I'm out here in the boonies, alas, and don't have such a club nearby.

The Elecraft K1 is a very good rig to get started in QRP -- though you might want to get the 4-band option instead of just 2 bands; in any event, there's usually a lot going on on 40 and 20, so they're a good choice. Between the Elecraft support and that of list members (on elecraft-L), you'll never be alone. In addition, there are plenty of older QRP rigs out there, from the spartan Heathkit HW-7 to the Ten-Tec Argonaut (505, 509, 515, and two more recent models). And there are a ton of single-banders you can build or homebrew.

You might want to take a look at the QRP mailing list -- it's pretty active and very informative and you can ask anything (but be prepared for possibly contradictory answers, all of which are right!). It's at http://qrp.lehigh.edu/lists/qrp-l/join.html and you're welcome to join right now.

Welcome to the ranks! Have fun...that's what it's all about.

- Joe, W2RBA

One way to go would be to find a nice older full power rig, like the Kenwood TS-520 someone here has for sale. You can run those QRP, or at full power, and they are really nice radios, and tough as the day is long. I'm sorry sometimes that I got rid of my 520, I haven't had anything with as nice a receiver in it since.

I worked VK9NS, Norfolk Island, while running 1 watt on SSB.
Got a 55 report.
Jim was running 2 watts and was 57 here.
This was on ten meters.

When conditions are good you can work almost anywhere on the
planet with QRP. A reasonably good antenna helps a LOT.

40M CW is a very good band for QRP work, I've had a lot
of fun while running from 5 to 30 watts to simple wire antennas.

The 520 was a great rig in it's day, but this guy wants to travel and go camping with his rig. A 520 would not be a good choice for that. Besides, there's only a 2-3 "S" unit difference between 5 watts and 100 watts. When the bands are open, it makes little difference...

You might consider a new or used rig from the Icom 706 or Yaesu FT100
series. They're pretty cheap now. Small and easily portable. And you
can operate them either at the 100 watt level, or crank them down to
QRP level. The problem with a QRP rig is it only that -- a 5 watt or
so rig. You may or may not be happy at that power level, once you get
on the air. QRP requires good propagation conditions, good operating
skills, and very good antennas. It's not necessarily the best choice
for a beginner.

Many of the people who are enthusiastic about QRP also have big
kilowatt rigs on the desk.

4748. FS FIAMM 12 Volt, 24 Ah Batteries

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-14 14:51:06 UTC
From: Charles Hugg <chashugg@earthlink.net>
Message-ID: <uJswa.71349$4P1.6525782@newsread2.prod.itd.earthlink.net>
Source record: 30331

I have for sale FIAMM 12 Volt, 24 Amp Hour Sealed Lead Acid Batteries. These batteries have never been put into service
and they have been kept charged to maintain their capacity. They are great for portable use. I am running a 2 meter rig off one and my Icom 703 off another. At 24 Ah capacity they last a long time. I have several up for auction on e-Bay and I also sell them directly. The price is the same: $15 plus shipping of $12.75 in the lower 48.
You can see them at:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2729188247
Thanks, Charlie Hugg, K5MBX

4751. HTX-252 Problem

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-14 17:37:24 UTC
From: "Mike M." <>
Message-ID: <hnu4cv058kmlgvolt05ujlbsvu9dv6hgpo@4ax.com>
Source record: 30334

I recently bought an HTX-252 on close out for $70. It might be worth that if I can solve this problem. I had it in the car for a couple days until I could get my V-8000 installed. It worked as expected.

I've got it in the house now and when I transmit on low power, it has a loud squeal with the audio making it unusable. The squeal is reported as being barely noticeable on high power.

My SWR is less than 1.5:1 across the band. The antenna is a homebrew J-Pole collinear fed with a 4:1 coax balun. I'd suspect RF on the feed line, but why would it be better on high power? The balun should minimize that anyway.

The power supply is a 12 volt battery in the basement and I had to extend the power cable about 6 feet to reach it.

Any ideas and suggestions?

TIA
Mike

I am trying to determine if a less expensive model exists, as I have been told. I know about the Am-Com "ClearSpeech", The Gap "Hear It", and SGC's "ADSP2", (all $150+) but I was told some CB shops somewhere are selling an equally good unit for under $50. Can anyone substantiate that rumor with a make and model number?

Before you do that .. check it with another antenna/feedline. Even a
magmount brought inside the house. To see if it changes anything.

By the way, I bought a 252 as well at that price I couldn't resist.
However, I'm getting "muffled" audio reports on transmit.

I've had some luck with the 252. With respect to the muffled audio,
the FM deviation is too low. Open the radio and adjust the R2 pot,
clockwise a half turn. That should work. It is directly below the
spaker when you open the radio.

With repect to the squeal, I've found that the squeal is the opposite
problem, The R2 pot needs to be backed down a 1/4 turn. If that
doesn't work I would consider returning the radio.

It is a good radio for the money once you get the deviation problem
fixed -- it draws little current at 10 watts and can be operated from
a gell cell. The biggest drawback is the lack of memories or tone
scan. It is a great beginner radio or second radio.

Best

Both units I would seriously rate a 10/10. Details available here:

http://www.durhamradio.com/ar8000.htm

This radio originally sold for $795 CDN ($576 US)

http://www.durhamradio.com/olinx.htm

Originally sold for $259 CDN ($187 US)

Picked these up recently but I don't think they will be my cup of tea.
Please note, this radio is the export version with full coverage from 500
khz to 1900 mhz, absolutely no gaps. Will entertain all offers, looking for
Kenwood HF gear, SM220, SM230, DSP100, etc or small mobile HF radios like
the TS50, Icom 706, FT100 etc. Can't provide pictures as computer with
digital camera interface is down, but I guarantee both units 100%.

Please reply off list ve3tmt@rac.ca

Not that I expect hi-fi on this rig, but AM sounded unnecessarily bad. Seems to distort when an AM station modulates its carrier to 80% or more. Problem happens when the carrier reaches a low point (when the audio sends it down). Clipping.

I took out D30 and L19 off the IF board. I used an NPN transistor similar to a 2N2222, collector to 8V supply, base to where the anode of D30 went, and emitter to where the cathode of D30 went. A 1K resistor from ground to the base, and a 3.3K resistor from base to 8V. And a 3.3K resistor from emitter to ground, and a 5000pF cap from emitter to ground. Somewhat similar to an "infinite impedance detector" tube circuit. What happens is that the transistor only conducts at the peak of the AM carrier (at 455KHz). This makes the emitter charge up the 5000pF cap. Then between peaks the 3.3K resistor slowly bleeds off this charge. The RC time constant is selected so this bleedoff is faster than audio rates.

AGC is extracted elsewhere in the set.

I kept the removed parts and taped them to a metal shield on the back of the front panel display so I or a subsequent owner could restore it back.

Motorola Radio Interface Box- RIB PROGRAMM/FLASH interface

WE can offer BEST quality, professionally Factory made Motorola Radio Interface Boxes of Special design and function !

Apart from being able to READ and PROGRAMM radio CODEPLUG, our RIB can also FLASH UPGRADE Firmware into radio !!!

Operating Mode is simply selected by nifty Push Switch !!, LEDs are denoting given mode of operating, either NORMAL or FLASH mode.

Also, LEDs are showing status of communication over RX, TX lines ! so user can easily eliminate problems like faulty cable, etc.

We give 12 months warranty on our RIB !!!

Each RIB is tested before released to customers !!!

Unlike some cheap clones, our RIB works perfect on any Motorola 2 Way radio !!!

Price per one RIB is 110 USD !

We can deliver any given quantity !!!

On more than 10 pieces we can also offer good discount prices

orders and inquiries

sales@commselect.net

you can see picture at our FORUM
http://www.commselect.net/forum/index.php?board=6;action=display;threadid=13

<< I'm looking for a QRP rig, and was wondering if the MFJ 90XX series still has a drift problem. >>

Rob-

We've been spoiled by modern digitally synthesized equipment. It may be that the MFJ 90XX series is typical of analog VFO rigs. Not all are as stable as Collins!

You might call or write MFJ and ask if there were any upgrades to the design. Don't bother sending them E-Mail.

Only the newer ones are, and I assume the TS440SAT is one of those, but
everything has been said about antique radios that there is to say, so it
is necessay to talk about the newer ones, as well as Iraq and the like, so
that there is some discussion to keep the group alive.

Do you have the AGC set to FAST? That's where it should be set for AM
reception. Make sure you've got any SSB filters turned off, too!
Even then, the ham rig is really too narrow banded for using it to
receive AM music. On "wide" they are only 6Khz bandwidth, limiting
your audio detection to 3 Khz.....which sucks for anything not voice.

This is probably the distortion you're hearing, bandwidth clipping.

Hallo,
I have a Standard C-58 that has some problem, probably with the microprocessor (TMS1300); when I leave it powered, after some time it doesn'respond to the knob or to any button. I have to leave it unpowered for some hour to return to the normal functioning. Has anyone tried to understand if it is possible to change the microprocessor with some PIC ? Could it be possible ?

Thanks,

Claudio

And, he said looking closely at his 6 Khz xtal filter bandpass
chart....the one with the nearly VERTICAL walls on either side of that
6db down picture.....

The ceramic or xtal filter skirts are way too steep for "hi fi".
Modern ham transceivers suck for AM radio receivers. They're made for
voice stations CLOSE TOGETHER, after all.

The 30S-1 R-F Linear Amplifier consists of a one-stage linear amplifier and the necessary power supplies. It is capable of maximum legal input power in the amateur bands between 3.5 and 29.7 MHz. It operates in either CW or SSB service with any exciter (such as KWM-1, KWM-2 or 32-S1, etc.) capable of 80 watts PEP output. IN addition, the amplifier may be operated outside the amateur bands at any frequency between 3.4 and 30 MHz by retuning its input circuits. Serial number 11590. This amplifier is of museum quality. There are no scratches on the unit anywhere. The face is perfect except for some rub wear on the on/off buttons. The unit is in perfect working order and uses the 4CX1000A tube. This amp will come with the original Collins manual. The pages are still crisp and the book has no pencil marks other than the serial number on the front cover. The manual is dated March 15, 1965. Amp will be crated for shipping. Shipping/insurance/crating will be paid by the customer. Amplifier weight is 160 pounds. 30 5/8 in. high, 17 in. wide, 18-3/4 deep (overall dimensions) Crating for shipment will add 10 to 25 pounds to its shipping weight. Local pickup in Southern California (Los Angeles area) is preferred.

Asking $2500.00 plus shipping.

Yaesu FV101B External VFO

The FV101 External VFO has been designed to provide versatile operation with the Yaesu FT 101 transceiver.

This unit eliminates the need for a separate receiver or transmitter in order to operate cross-band. For the contest operator, DX chaser, or Net Control Manager, the FV101B becomes an indispensable adjunct to the station.

Asking $125.00 plus shipping/boxing/insurance.

I can see how this provides low-impedance drive, but I don't quite see how it prevents downward clipping, presumably caused by capacitors downstream that back-biased the original diode. Won't they just back-bias the transistor? Or is the 3.3K so much lower than what was there before that the downstream Rs are now so large by comparison that very little back bias is developed?

<< I've had some luck with the 252. With respect to the muffled audio, the FM deviation is too low. Open the radio and adjust the R2 pot, clockwise a half turn. >>

Vinnie-

I understand that R2 is the peak deviation control, not a microphone gain control. I noticed that my audio level seemed low, but found that the peak deviation was correctly adjusted. There just isn't enough gain between the microphone and the limiter. If you increase audio with R2, you could have a problem clipping-out of the repeater on voice peaks.

Since I didn't have a diagram or service manual, I couldn't tell if there is another gain control to try. I tried speaking very close to the microphone element, and that seems to have done it. The element is at the top of the microphone assembly.

Many people hold the microphone several inches in front of their face, which might be OK for a broadcast radio station, but it is not for a communications system like this. For best speech-to-noise ratio in a noisey environment, you must speak close to the microphone, perhaps 1/2 inch away. That seems to be how my HTX-252 is adjusted.

The best short wave receivers in the world would only employ a 6 KHz filter
on the crowded short wave bands. After all the spacing between stations on
short wave is only 5 KHz........cheers, Ken, G4KIR.

I think you're missing the math. A 6kHz filter doesn't equate to 6kHz
of audio. It only gives +/-3kHz of sidebands. Thats why 5kHz spacing
works.
Now if one side or the other is interference free and if your rcvr has
an IF Bandwidth type of tuning (passband) like a Drake R4B, etc., then
you have the possibilty of capturing wider audio, wider than 3kc.

Fred,

I think you have it right. I don't have the service manual either, and
I'm not likely to invest in one. I poked around turning pots and found
that R1 adjusts the power output. I have two of these radios now and
both are very different. For one radio I have to speak very close to
the mike to get the audio level up, as you do, on the other --there is
enough gain ahead of the limiter to have the R2 pot fix the problem.

When AM swl-ing, I like to play my nrd-525 in its 12 khz bandwidth. I
pick up a little more atmospheric noise, but lots more fidelity than
the 6 khz position. Course, I'm only listening though a 5-inch nrd
speaker...

Source record: 30247

I have a RS HXT 242 that has me scratching my head.

The radio will not allow direct entry vfo-a or vfo-b. if you rotate the tune knob it will show 144.005 and will tune up to 145.595. I have done a hard reset but to no avail I have the
same problem. I have tried a direct entry via the dtmf and it will not allow entry of any numbers past 5.995. it will scan from 144 to 148 but no direct entry.

I am prepared to apply a blunt force object across the top of the radio and scrape the parts
in a trash can.
Anyone run into the same problem?

>

The transistor acts like an emitter follower at the positive peaks of the
AM carrier. This amplifies the current available to charge the cap on the

emitter, and the resistor slowly bleeds it off. This circuit isn't
bothered
by the caps downstream.

This circuit is only used to detect the audio, AGC is developed elsewhere
in the radio.

Hi, before you cut it up into radio shack nibblets you might want to disconnect
the memory battery for a few days along with the power source. After time goes by try resetting
the cpu once again.
I had a HT a while ago that was doing something stupid and would not reset no matter what. I removed the batteries for a few days then hooked them up and did a reset and wala! It
worked. It's weird but sometimes all caps inside a radio must be completely drained of power for
a reset to work.

GOOD LUCK, Mark

From: Hartley Garshowitz <hushyg@rogers.com>
Message-ID: <3EC63BB0.7E50F955@rogers.com>
Source record: 30155

I would like to sell this Yaesu FT301D and FP301 power supply. I bought them from my cousin in 1978 together with his car, before he moved from Canada to the US (the car is long gone), with the intention of getting my licence. That won't happen in this lifetime.

It was briefly hooked up in 1979, and has not been used since. It was top of the line equipment then, but I'm sure new technology exceeds its

capabilities.

Any interest? Any offers? It's time to clean out my basement.

Actually, what is needed is a 6 meter, 2 meter, 220, 440, and 1.2 gig ALL MODE rig with 50-100 watts and full duplex cross band repeat. Skip the HF altogether. Most who run HF already have a good HF rig, just produce something to cover the VHF/UHF bands in a useful configuration.

I run an Icom 756 Pro for HF, and I am very satisfied with it's performance, and have no desire to upgrade/replace it. But there is a definite void to be filled (try to find a 220 all mode rig) for a companion rig of similar quality and features covering the other bands. It could be a modular unit for example, where it comes with 2 meters and 440, and you can add modules for 6,220,1.2, 2.4 etc.

I suggested this to both Yeasu (an updated FT-847?) and Ten Tec (an updated model 526?), but the suggestion apparently falls on deaf ears.

I personally have almost no use for base station radios, especially the caliber of the 7800, with VHF/UHF on them. I realize I'm in the minority. I have no doubt that people who want the very latest in technology, will buy the 7800.

Van,

I have had most rigs out there over the past 45 years. Most recently with the rigs that cover HF and some VHF bands I have found that NONE does well on 144 and above. Stand alone 2m and 432 rigs always have better specs, gain and rejection to high traffic overload. That's why the 275H Icom and other preceeding it do better , as does the Yaesu 736R for strictly VHF/UHF work. You can NOT squeeze proper circuitry for VHF/UHF low signal work into a box the same size as a normal HF rig ... You always need a preamp it seems, especially on 144mc and up and proper design adds to space limitations in an HF box. My 746 is horrible on 144 and adequate on 6 meters. The 551D and 736R will outperform the 6 meter portions of any combined HF/VHF rig I have seen, except perhaps the wonderful JRC 245. Final word in nutshell is that no rig I have seen that combines HF and VHF/UHF will prove very effective above 52 MC and most lose effectiveness above 10 meters. Something always suffers when you stuff too much marginal design into a small, reasonably priced rig that appeals to thousands. If the rig is truly great on 6 and 2 the cost would be in the $6000 range... perhaps the 7800 comes close, albeit without 144mc. Time will tell. Til then, get a good converter or stand alone rig for work above 50 MC and always be prepared to buy a preamp. None work well alone, even with GaAsFET front ends.. For the same $10,000 I would prefer 2 Icom 781s and a 746 with 6 meters and a matching 4KL or PW1. San K5YY

Source record: 30170

HELLO ALL,

Just got a HTX 10. (Rad-shack's 10 meter all mode 25 watt rig)

Does anyone know if any antenna company makes a fiberglass whip that can be bumper mounted (3/8"x24 thread) for the 10 meter band ? I would like something between 4 1/2 to 5 1/2 feet long so I can clear the garage ceiling. "Ham Sticks" are 7 foot long and will not fit into the garage mounted on my bumper.

I looked at the specs of a Wilson 5 foot rigid fiberglass whip that has a steel top section for tuning, intended for the 11 meter band. I'm told it will not tune to the 10 meter band.

I tried a 4 foot K40 flex whip (11 meter). The tuning "sleeve" ended up at the bottom of the antenna and the SWR was 2.5>1 at 28.305 mhz. It gets worse as the frequency increases (3>1 at 28.325).

Base loaded antennas intended for 11 meters will usually tune to the 10 meter band however a bumper location is less desirable for that type of antenna, right ?

I'm thinking that the more antenna I have above the bed of my pickup truck the better the performance. Again however I am limited to no more than 5 1/2 feet from the bumper to the top of the antenna so I can drive into my garage without tearing up the antenna, garage door, and the ceiling.

My next thought was to install a wire dipole or Double Bazooka coaxial dipole under the fiberglass "A.R.E." brand lid on my bed (looks like a big trunk lid). I have a short bed so I would have to probably feed it near a corner in the front of the bed and run it around the outside edge under the lid, bending it at the opposite corners.

The truck is a 2003 Dodge 1500 4x4 Quad cab short bed.

Any ideas on either antennae ??

Hi Dale,
many thanks for the infos. There are also some more new data.
Hope to see something of that also in June on the german HAM RADIO.
The "european hamvention" :-)

Hello everyone,

Sorry for the off-topic post, but I braved the weather at Dayton Saturday
and
picked up a Millivac MV-823A-1 RF millivoltmeter. I was wondering if
anyone might have a manual for it that they no longer need, or if someone
might know of a source for one. It was completely soaked, but after a good
drying out it seems to work. Thanks,

Kevin, K9HX

It used to be I seem to remember the Europeans used something like
8.25 KHz channel spacing and North America uses 25 Khz until you get
real high flights. Battery charger operating voltage is 220 V.

So it is possible the A4E would not be useable in the US.

4853. Re: Icom 2410H powers-up transmitting

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-18 15:19:15 UTC
From: fmmck@aol.com
Message-ID: <20030518111915.15389.00000180@mb-m18.aol.com>
Source record: 30185

<< When I had a problem with a newer radio, I dug out the old IC-2410H to use as a
spare. I just happened to notice that it was transmitting for a short time
after turning it on.

I mentioned this to a friend who still uses the same radio, and he had the same
problem. He suggested disconnecting the microphone, which stopped the radio
from transmitting.

The HM-56A microphone appears to be where the problem is. It is a very
sophisticated microphone that even has its own CPU! >>

In case anyone is interested, I think the mystery is solved. I contacted Icom
and they E-Mailed me a diagram and parts list for the HM-56A microphone.

It turns out that there is a lithium battery inside the microphone. The radio
is several years old, so the battery probably died from old-age. There is an
electrolytic capacitor involved that may be leaking, but I plan to take a
chance on just replacing the battery. If the new battery runs down too soon,
I'll know where to look.

Apparently the microphone comes on with P-T-T keyed if the battery is dead.
When the battery is providing power, the microphone is programmed for the
Push-to-talk line to be high. With a dead battery, the P-T-T line starts out
low until the radio's power supply charges a capacitor that the battery would
have kept charged.

Greg-

Thanks a lot! I have seen that web site before, and found some information on a Ten Meter SSB Handheld radio. It helps to be able to cross-reference between Radio Shack's and the manufacturer's part numbers!

Looking at the diagram, it isn't perfectly clear, but gain may be set by a particular resistor connected between two pins on the microphone amplifier chip. If I can find more info on the AK2345 chip, an improvement may be possible.

For Sale:
Hallicrafters HA-2 CONVERTER for 2 meters!
Comes with P-26 power supply, all untested because I do not have the cable assemblies.
All appears complete & in good condition, nothing appears to be burn't out.
Includes the Ameco "VHF" converter and a 12vdc coaxial relay under the chassis, I don't know if this was optional.
The cabinet is good condition, all correct knobs & feet.
The top 1/2 of the Front panel is Very good, the lower 1/2 has some paint "flaked" off, this can be redone to restore it, I don't have the time!
it is very heavy to ship, 2 packages, 30 & 32 lbs from 11758.
Many Pics.

<< Does anyone know if any antenna company makes a fiberglass whip that can be bumper mounted (3/8"x24 thread) for the 10 meter band ? I would like something between 4 1/2 to 5 1/2 feet long so I can clear the garage ceiling. "Ham Sticks" are 7 foot long and will not fit into the garage mounted on my bumper >>

Jim-

I think any CB antenna that meets your length requirement and has the standard 3/8 inch mounting will work. Of course you need to be able to trim a little off the top!

Another alternative is a Hustler fold-over mast, using a Ten Meter resonator. They make two versions - one that folds high for bumpers, and one that folds low for fender mounting. I'm using the fender version on a triple-magnet mount on the roof of my Toyota Corolla, so it fits into the garage with a little room to spare.

Based on my experience, the triple-magnet mount has problems, although the antenna works quite well 75 to 6 Meters. It seems that even a small tree limb will take it off, and some drive-throughs are a little too low. There are rust spots on my roof from the magnets, and dents all over from the times it came off! I wonder if the four-magnet version would be better, or would it just make bigger dents?

It better be good since the Ten Tec Orion is less than half that and
blows the PROII away in receiver performance - something like 43DB better at
close in third order intercept point.

4867. Problem with through glass antenna

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-18 17:33:49 UTC
From: zoarimp@aol.com
Message-ID: <20030518133349.29027.00000181@mb-m26.aol.com>
Source record: 30100

I am having a problem with a through the glass antenna on a new car. Does anyone have experience with these and with different autos?

I have a 2003 Buick Century with Solar Ray glass and aftermarket tint. I removed the tint (but about 1/32 is under the 2 way tape on all sides). The antenna cannot be tuned at all.

I have the same antenna on a 1993 Chevy Lumina. Also has Solar Ray glass and aftermarket tint. The differences are that the car is 10 years older, I removed a little more tint (about 1/32 AWAY from coupler instead of under it) and the older car DOES NOT have a rear window defogger (although I did not mount the antenna on the defogger, I went as far away as possible).

Any help would be greatly appreciated.

Thanks,
Mike

Source record: 30101

If that after-market tint is metallized, I think you will need to get it farther away from the mount. Also, the factory Solar Ray glass may have some metal in it. You need to keep away from the darkest parts of the tint. On our Jeep Grand Cherokee, there is a dark band around the edges of the window. I stayed inside the dark band, and the antenna worked great for the 11 years it was on the Jeep. This was a Larsen 2/440 glass-mount.

It's a little late now, but you can test the location(s) by using double-sided carpet tape temporarily. It's easy to remove. You will need a remount kit to permanently remount the antenna in a location that works.

I would like to know if it would be a good idea to ground my station to the metal frame of the doublewide trailer that I live in. It is bonded to the service ground and I can bond the station to the frame. The shack is at the other end.

Would it do any better then a ground wire run from the service panel to the station?

Go to a truck stop & see the variations of fiberglass whip antennas there.

|other end.
|
|Would it do any better then a ground wire run from the service panel to the
|station?

RF wise, yes.

If it was me, I would probably put in an eight foot ground rod at each
corner too. You never know how good the made ground at the service
panel is and I wouldn't want to be standing on the ground while
touching the trailer if there is a bad ground.

I live in a masonry house but since the cold water supply line is
plastic, and the copper line under the slab is plastic wrapped, I dug
a trench around the whole house and buried a 4 AWG bare copper wire.
All of the outside cold water faucets are bonded to it and I have a
couple of 8' rods here and there too.

Unfortunatly, the last Ham store in Seattle closed a couple of months
ago. I'm not sure if it is possible to order ham radio equipment from
a Vertex/Standard (distributors of Yaesu) commercial dealer but I'd bet
for sure they would not keep stuff in stock.

So, I guess mail-order is it. Bummer, huh?

I have an elderly 350 mHz Pentium box I'm setting up as a dedicated ham station 'puter. Rig control, spots watcher, contest logger, etc. and while I'm at it I'd like to load a good sound card into it for the HF digital modes, particularly PSK31. Does anybody have any recommendations in this respect?

Also what's the best (Windoze) PSK31 program?

Tnx - -

A quick trip report for anyone who might be interested.
I arrived friday morning just in time for the opening. I walked the entire outdoor flea market looking for "treasures". What I saw was loads of horribly over priced Collins rigs and several older (kenwood 520,yaesu 101) rigs priced at about double what they are worth. There were bargains but you had to be quick or they were gone.
Saturday morning I had great expectations of finding a good buy on a used HF rig only to have them washed away by the rain that started one hour after the opening and lasted all day ruining the outdoor flea market so I headed in Hara Arena which was packed....I was amazed at the number of ham operators who smelled like they had not had a bath in several days nor had they combed their hair or used deoderant...The stench was overbearing so I went back to my motel room as I had a early Sunday flight back home.
Overall not a horrible show but the weather really hurt everyone. I also wish people would bathe before mingling in a crowd....Better luck next year!

4882. Dayton 03 trip report

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-19 16:07:39 UTC
From: Mike <mpautodets300@yahoo.com>
Message-ID: <3ec90135@snipnews.snip.net>
Source record: 30114
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.swap

Well, I made the long trek to Dayton from
Delaware after missing Dayton 99/01/02
due to business. Somewhat easier this year
travel wise as I flew in via my partner's
Beech and all that was necessary was to
get a rental car once we landed at the airport.

I sorta wish that I'd stayed home. We got there
late Friday afternoon, got our room (reserved)
in Dayton and decided to go out and have
dinner, then hit the Hara early Sat morning.
Met many hams at our dinner and got to talking.
More so with my friend Carl (who is not licensed)
but told them many of his aero-stories and yearly
trek to Oshkosh. (Oshkosh is to general aviation what
Dayton is to Ham Radio and Mecca is to Islam)
I WILL make a trip to Oshkosh later this
Year FOR SURE!!

We get to the flea market bright and early...and it begins
to rain. A cold damp flea-market killing rain. This while
we were waiting in queue to get in also. I do not know
why but can someone please tell me why the dumbest
and dimmest-lightbulbs-in-the-drawer always seem to
get gate duty at hamfests?

We get inside and we are greeted by dozens of tables
on saw horses covered in blue plastic. Some had the sense
to bring poles and set up a makeshift tent/cover.
Just about everything that was available for sale on the
outside flea market (that was not water-soaked and thus
rendered as "damaged goods") was obscenly overpriced.
On guy had a TS-520S that still had pizza-sauce stains on the
main tuning dial. He wanted $400 for it. (Good luck pal, hope
there are lotsa suckers in attendance) We decided to go
inside. I felt like a sardene in the can. I got to see Icom's
new IC-8500 or whatever. The MSRP is $5000 for it.
I do not know about you but ANYONE who would pay
5K for a ham radio NEEDS to have their head examined.

Yaesu had a nice display, but then again I feel Yaesu are
the best engineered and designed radios going so I am a
bit partial. If you open up the covers of a Yaesu and and
Icom and a Kenwood and lay em side-by-side the difference

ir readily apparent. Yaesu looks like someone put some
thought and CAD into their designs. Everything fits into
place like the inside engine compartment of a Honda Civic!
Icoms and Kenwoods look like the inside of the $65 Korean
made VCR you just bought at Circuit City. Thruhole components
and wires all bent over, SMT components placed hap-hazardly
and the cheapest sheet-steel chassis used. Yeah...I'm REALLY
going to pay $5000 for an Icom that has a laptop LCD screen on
the front and inside looks like a rat's next of circuits with no
way for heat buildup to get out. (Attn all suckers! Blue Light Special
at the Icom Table!)

We left after just 3-4 hours, got some Pizza and beer, walked
around the airpark shop looking at all the new aero toys (my
friend was drooling at some kind of a NAV aid in a glass case
at the store like I would at a new Yaesu HF) and we took off
at around 5:00

Sorry Dayton, but I will not be back. Not because the Wx
crapped-out Dayton 2003, but because it makes no sense
to goto a convention, be wet and crowded in and uncomfortable
just to look at grossly overpriced radios. Better to purchase
online or go up to HRO's store in Newark Delaware which
is just 1/2 hour north of me.

See you Boys in Oshkosh!!!

This Year's dates are July 29 to Aug 04, 2003

Source record: 30115

I have for sale an exceptionally nice Kenwood TM-742A Transceiver. It
includes the stock 2 meter and 440 Modules Plus the 6 Meter Module(UT-50S).
I have the mic, power cable, mobile mounting bracket, manual, plus the
original box for the UT-50S. I also saved the insert that is removed when
the UT-50S was added, so it could be replaced if the a module were removed.
The rig works and looks as new. Price is $575 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

Better, cleaner , nicer, no smell!! Except the smell of first class
operations and success!! Coming in June see ARRL

4888. FS AS NEW ICOM IC-703 and Accessories

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-19 20:14:36 UTC
From: Charles Hugg <chashugg@earthlink.net>
Message-ID: <MWaya.5296$rO.509385@newsread1.prod.itd.earthlink.net>
Source record: 30120

I have a 2 weeks old Icom IC-703 for sale. This is the new QRP version. It runs up to 10 watts and has a built in latching
antenna tuner. I just need more power for mobile. This rig has exceptionally low current drain in receive and is great for battery powered operation. I have used it for maybe 3 hours total. It includes all the stuff that comes in the original box, i.e., the mic, power cord, manual, and extra fuses, etc. I also have the receipt from the dealer and have not sent in the Warranty Card, so it should be covered for full warranty. I paid $669 and will sell it for $579. I also have an Icom RMK-706 Separation Kit including the MB-62/MB63/OPC-581 all never out of their original boxes. This kit cost $70.99
and I will offer it to the buyer of the 703 for $50. Thanks, Charlie Hugg, K5MBX

4889. Re: Dayton 03 trip report

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-19 20:26:25 UTC
From: Skipp <skippsaysspamtheotherguy@yahoo.com>
Message-ID: <babelh$ks2$1@woodrow.ucdavis.edu>
Source record: 30121
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.swap

I also made the Dayton trek from the west coast and thought it very much fun.

Friday was very nice, the weather was great for Dayton at that time of the year. Had a chance to see an overview of the flea market at that time.

Prices don't really drop on many items until late Saturday or Sunday. But you knew that right..?

Saturday weather wise was not so great... about 60% of the time it rained past the point where dealers wanted to uncover. Quite a few serious Dayton people did bring weather fixtures. Others just called it quits for the day and went inside to look around.

There were brief spells of clear weather during the mid afternoon, but many people didn't open back up right away.

Sunday found the weather great, things dried up and the last portion of the event found the remaining people really dealing up a storm. I'd say at least a third of the Friday/Saturday Flea Market People left Sat Night. That's typical for Dayton.

But the whole thing wrapped up on a high note for most everyone who stayed through Sunday.

In 2002 the wx was not so great on Friday, but good on Sat/Sun. This year Saturday was the bad day for rain. Not much you can do about that. Most of the Saturday People stayed indoors and looked at the various booths, which provided a (reported) nice boost for indoor equipment sales.

Like all of the conventions and shows I've attended this year (10 plus) only 70 to 80% of previous high numbers were made... this includes commercial communications shows I've attended (like IWCE). Shows have been smaller is size overall. Daytons' ~80 numbers are no surprise...

Many of the commercial two way radio shops trying to dump large quantities of used radio gear were gone this year. But there were more than enough there to find a good deal on commercial radio "boat anchors".

The only part I didn't think so great were the Computer Suppliers hawking their wares... but when you have empty sales spaces, might as well have them there than nothing. No one was displaced by them being there... plus quite a few of the local Dayton kids/people came in to see the Clear Computer Cases with Neon lighted fans and internal lighting.... or of course the stainless steel computer cases. They really looked cool...

Many of the true "Nuts and Bolts" of Amateur Radio Mfgrs were on hand. Seems the slow economy shakes out a lot of the loose ends as evident by this years numbers. But all the normal "players" were on hand to show off their products. Ten Tec had a really nice booth this year...

Side trips around Dayton included the massive Wright-Pat AF Aircraft Museum, just incredible to be in a room with B-52 over your head. One could easily take a few days to view the W-Pat aircraft displays. You've got to see the place to believe it.

Friday eves finds many at the Weak Signal, VHF and above dinner at the Holiday in. Just a great time over all. Many of the larger Radio Companies also had their own parties and events. Reports of the typical antics at various evening parties are now floating in (as recovered from the hotel pool).

I had a great time, will go back again next year as always. Picked up some great deals on things I wanted. Hard to argue with a $214 air fare from the West Coast.

cheers
see you next year at Dayton

Greetings all I am in need of Microphone information on a Azden PRS-400. I just acquired a unit and it was without a microphone. If anybody out there has a microphone that will serve and/or a schematic or manual I would be grateful. Gladly pay any costs incurred.

I am also trying to locate a connector for the Wilson WRY-500 Antenna Rotor. I need the outside 8-Pin female connector that looks like a Cannon connector. If anybody has one that will work or could point me to a source, that too would make me grateful. Please respond to my email address. Thanks Don Smith KB6GQA

I have tried several of the cheap sound cards and also several computers
with the built in sound . They all seem to work ok for me. You might find
a program aor two that will only work with the sound blaster brand card but
I think they are older programs .

4893. ISO Couple of MT-8860 and MT-8865 IC's

I am searching for a couple of the DTMF IC's used in a Comm Spec Repeater Controller. They are Mitel MT-8860 and MT-8865. Could use a couple of each or any other replacement IC's that would work. Please respond to my email account. Thanks Don Smith KB6GQA

Basically, you can't mix and match those things. You're stuck basically trying to find someone who has kept the exact model microphone with the exact frequency (unless you want to recrystal). I see receivers at hamfests all the time but nobody ever remembers what happened to the microphones.

Because they use companding, you can't just use a Shure mike on an Azden receiver and expect it to work decently.

Is it a Cannon P-connector style thing? If so, Connector World Supply in Seattle will have it.

I have done well with the generic variety also. But stay away from the
YAMAHA....really problems on levels, and on SSTV...forget it. I use Sound
Blaster with NO PROBLEMS.

Well now, I have a Yahama YMF724 sound card that works just great on PSK31
also the built-in sound on my ECS mobo. No problems with either.

Hello again !

Thanks for all the responses ! I have decided that the best antenna for my situation is the Anttron Mod. #1700. This antenna once tuned is slightly less than 6 feet tall. Most 11 meter fiberglass whips are 3 or 4 feet in length. They will work by trimming them down but as I was saying, I wanted as much antenna above the bed as possible but not over 6 feet total length from the bumper mount to the tip. The Anttron #1700 has a fiberglass helical section at it's base which is only 2 feet long. A 4 foot SS whip top section is slid in the fiberglass sections tip and pruned for the desired frequency. I'm told the #1700 is broadbanded compared to the "Hamstick" for 10 meters. Anttron went out of business, not due to bankruptcy or anything like that but due to it being a family ran business and a member was lost, so I'm told. The tooling and machines to build Anttron antennas were bought by a company in Oklahoma. They are now producing all new Anttron antennas and I'm told they are developing new ones, like the "Hamstick JR.", a 6 foot long version of the "Hamstick" (7 foot) antenna. I ordered a #1700 antenna direct from them and should have it before the end of the week. Thanks again to all that posted or emailed me on this subject. I am still going to experiment with a wire antenna under the fiberglass lid when I get the time.

Scroll down below my signature for more info on Anttron (Oklahoma) the Anttron antenna I'm getting.

Here are some neat National and Millen parts for sale. Prices do not
include shipping.

National Type MCN Dial - new in the boxï¿½..$60 plus shipping
Photos:
http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

National Type K Dial Assembly - New in the Boxï¿½ï¿½ï¿½..$35
Photos:
http://members.cox.net/radiostuff9/type_k.jpg
http://members.cox.net/radiostuff9/type_k2.jpg

Large Millen Dial - New in the boxï¿½ï¿½..$20 plus shipping
Photos:
http://members.cox.net/radiostuff9/millendial.jpg

National Type SCN Dial - New in the Box.....$65 plus shipping
Photos:
http://members.cox.net/radiostuff9/scn_dial.jpg

National Type ACN Dial - New in the Box.....$75 plus shipping
Photos:
http://members.cox.net/radiostuff9/type_acn.jpg

Matched Pair of Large Millen Dials.....$35 plus shipping
Don't know if these are new but they are in excellent condition
Photos:
http://members.cox.net/radiostuff9/2millendials.jpg

National HRO Drive with Variable Capacitor .....$100 plus shipping
Looks new - no box. Their was a loose PW dial on this hence the marks on
the shaft
Photos:
http://members.cox.net/radiostuff9/hrodrive.jpg
http://members.cox.net/radiostuff9/hrodrive2.jpg

National HRO Drive .....$50 plus shipping
Good condiition - no box.
Photos:
http://members.cox.net/radiostuff9/2ndhrodrive.jpg
http://members.cox.net/radiostuff9/2ndhrodrive2.jpg

National Black PW Dials ..... $75 each plus shipping
Two of these. Here is a chance to replace that chipped up dial on your
HRO receiver.

These look to be new. No box - a couple of very tiny paint chips
Photos:
http://members.cox.net/radiostuff9/hrodial.jpg
http://members.cox.net/radiostuff9/hrodial2.jpg
http://members.cox.net/radiostuff9/hrodial3.jpg
http://members.cox.net/radiostuff9/hrodial4.jpg

I will ship overseas.
You can check my user ID "n7rk" on Eb*y
for a reference as to dealing with me.

Thanks for looking and 73,

>Haven't seen any reports saying how wonderful it was.

OK...

It was great. As usual.

I found all kinds of stuff out in the flea market. Had a tough time resisting the Nikon LS-1000 slide scanner for $100, but was finally successful. I just came to the conclusion that scanning slides wasn't how I wanted to spend the next few years (I have 1000's of slides).

Made boneheaded move by not buying one of the 600W inverters for $40. What was I thinking? And... passed up the $6 ARRL repeater atlas - latest version, too. Was gonna get it Saturday - Ha. Rain.

Saw all kinds of neat stuff in the flea market to keep in mind for when I really have the money. One fellow there was showing off the "1 man tower" - a square, steel affair that has a Hazer-like tram up the side. Claims 19 Sq. Ft. at 130 mph and U only climb it once to erect it. The Hazer-like attachment is used in the erection of it. Free-standing tower, too, BTW. I got the literature - if I get a new tower, this will be a consideration. The tower is imported from Australia - they have a California-based PE that certifies the Aussie's calcs, for the zoning boards to puruse.

On the downside, I've seen _all_ the old Motorola and GE commerical 2-way rigs I will ever need to see - hams, other than repeater-erectors, really buy this stuff?

Moving inside, esp. during the rain Saturday, was a pleasant experience. The inside was _not_ packed. Posters saying it was, have never seen Dayton during the 33,000+ attendance of the April Hamventions. I was able to see everything I wanted to see, without much hassle in getting close enough to see it. Worst congestion was around the Glenn Martin tower displays around 3:00 PM when they were drawing for the 8' roof mount tower. A little crowded.

And while quite a few hams are overweight, I have a sensitivity for foul odors, and can smell a cigarette _all_ the way across a theater, but I smelled no one there.

I could have spent another week there, except that I'm not used to walking and being erect for that many hours in a day. My lower half needed good drugs! Tylenol was not "making it".

I managed to kill maybe a half hour just deciding not to buy anything at MFJ since they weren't discounting and I could get anything I wanted any time I wanted at the local Ham Radio Outlet store. I did take a while to mentally catalog the many varieties of swr / power meters they had on display. I didn't think there were that many different types of SWR/Power meters built.

Picked up various odds and ends I would have trouble finding anywhere else. Had already looked for the snap-on ferrite chokes for quieting RF interference traveling on wires, and found them at several places there - $2 each was the going price. Bought what I hope was a year's supply! <G>

Then there was grounding braid. Might have to pull the car's body and engine and tail pipe and etc. together electrically, eventually, to keep the HF rig from picking up a lot of hash from the car electricals.

Able to get 3/16ths inch aluminum rod for the 2M beam, too - without shipping costs or having to putz around ordering it. It was there for purchase in 12' lengths. Try finding that somewhere else.

Less CD's and less variety than in the past, but only really wanted QRZ Ham Radio for sure, anyway. The huge displays of CDs seem to have disappeared. Oh, well, most of the CDs had nothing to do with ham radio anyway... but they were fun...

And the lack of "crush" of people was pleasant. Probably was about 20,000 there last weekend - that is a pleasant number for that size property.

Anyway, _I_ liked Dayton. I'll be there next year, and the next, and the next, and hopefully every year 'til I'm dead.

Its just outstanding.

One thing I can say about Texas, they sure know how to throw a barbeque. I seen more marbeque establishments than I did McDonalds. But it don't much matter which way I go it's still a long way to either Dayton or Texas. Still a lot of fun though, but I'd see a lot more old friends at Dayton.

Thanks for your reply. I did stay clear of the dark top and the defogger heating elements. The tint DOES have metal in it, I am sure of that. I can cut back a little more, but I don't want to cut back too far.

The fact that this worked on the older car led me to believe that it would work here as well. But I have to tell you, I am just about ready to pop a hole in the metal and put an NMO mount in like I did in the truck(s) and had no problems.

Ahhhhhhhh. I thought the glass on the car would look better and I did it mostly to please my wife. Now I have a bigger problem, if I take the on-glass mount off, I have a ruined $200 tint job. Why isn't life easy.

Thanks again though, any other thoughts I wil absorb and work on the problem this weekend.

Happy Memorial Day to all, remember our troups, they are the greatest!

Mike

That's what I finally did on my Jeep Grand Cherokee. Although the
glass mount antenna gave satisfactory performance, the new antenna
(actually shorter) mounted in the center of the roof gives
substantially better performance based on how well I can hear distant
repeaters.

Surprising that it would cost you $200 to repair one window. I had
all five windows tinted on our Honda Accord and it only cost $167 for
the complete job. And that was using 3-M tint, and the best tint shop
in town. The same one Honda sends their cars to.

Dick

Hi all...

I'm still trying to find some of the original radio
equipment for my airplane (an Aeronca L3B "Grasshopper")...

The specific equipment I still need is:

AVT-15A Transmitter with Remote Control Panel
AVA-120 Trailing wire antenna (will trade for Lear RH-4)

Any help would be appreciated

<< but gain may be set by a
particular resistor connected between two pins on the microphone amplifier
chip. If I can find more info on the AK2345 chip, an improvement may be
possible >>

I found a Japanese version of the AK2345 data sheet which had a block diagram with English lables. There were also typical applications of three amplifiers it contains.

Gain for the microphone amplifier appears to be set by the ratio of R608 (1 Megohm) to the series sum of R602 (2.2K) and R248 (2.2K). Since R248 limits current to the Push-To-Talk circuit, I wouldn't recommend changing it. R608 is already quite high, so that leaves R602. Reducing its value should increase gain. (It may be easier to add a parallel resistor than to actually change it.)

Another possibility might be to shunt R248 with a capacitor of at least 0.24 Microfarads. That would increase gain without upsetting P-T-T bias.

Does anyone want to be the guinea pig?

Here's one:
Friday was a great day, the WX was mild and temps very comfortable.
Found a great deal on an Icom IC-551 6 meter all mode rig. Clean, and works
FB, $165.00
Later I found some small "gadgets" for the single tube transmitter I'm
building, and renewed my ARRL subscription.

Saturday was a bit crappy WX wise, still I found good deals on more
"gadgets", also picked up a nice hand key from N1TP. Found an old CB
vertical antenna for $5, this will get cleaned up and put onto 6 meters.

Sunday I went back to get my cards checked at the ARRL booth, and now I'm
waiting on my DXCC certificate! Found a good deal on 100' of RG8X and
connectors for the IC-551. Later this week I hope to get the antenna up and
rocking on 6.

As for the smelly fat people, dirty bathrooms, and all the other bitching,
who cares. Go to any event where the public is invited and you will find
them. Either don't go or get over it and have fun. I sure did and can't wait
until next year.

Perhaps the particular YAMAHA I had was defective. In anycase the problem I had was on SSTV. For some reason it placed a 'cross-hatch' pattern on the received SSTV signal. And I could not get it out.

When I changed to a SB card..no problem at all.

I second that motion for a "ham" sound card. Everything will work with
it. Windoze or even old DOS programs. Many of the newer cards use DOS
emulation and won't work with many programs. Anything "soundblaster"
is usually a good choice. I use an AWE 32 here, and does fine with
everything I run. I had a newer yamaha card before this one, and it
won't run DOS programs worth a hoot.
>
> > Also what's the best (Windoze) PSK31 program?
>

Good as any...I use it also, as it covers the other modes too. I use
MMSSTV for sstv these days. MK

I have a brand new in the box, Kenwood UT-28S 28MHz 10 Meter FM Module for the TM-742A Transceiver.
Seems like I paid around $330 for this unit and never used it. Looks like Kenwood does not make this module anymore.
Also, I have in the box a DFK-4 Detachable Front Panel Kit with the 13 feet long remote cable for the 742A . These are currently selling for $59.99. I am ask $175 for the UT-28S and $35 for the DFK-4 plus shipping.
Thanks, Charlie Hugg, K5MBX

4931. TS570D lost power in SSB ?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-20 20:16:17 UTC
From: Thierry <lombrytNOSPAM@hotmail.com>
Message-ID: <3eca8d14$1_1@news.vo.lu>
Source record: 30063

Hi,

A friend of mine is using a TS-570D (second-hand, manufactured in 1998)
connected to a 100m RG213 coax to his R7.
In parallel he is using (for 5 years) an old TS 840 with an external antenna
tuner and a watt-meter from Kenwood too.
He is very happy to work with this new rig.

But...according his tests, working with his new TS570D in CW his RTX emits
well 100W, measured on the built-in PWR-meter or on the external watt-meter,
that is very well accurate and gives true values according his measures.

But in SSB, where his TS840 emits about 100W when he whistles (confirmed by
both PWR-meter and his external watt-meter), his TS570D emits only 50-60 W
altough his built-in PWR-meter says that he is emitting 100 W !!!
All tests conclude that the TS-570D, in SSB mode, lost about 40 W and
display a false value on his PWR-meter !!!

Do you know that problem specific to SSB ?
and how to solve it ?

NB. The fact to switch off the "AT Tune" produce no major difference.
I review this RTX on my website but not the emission part....
If the fact is confirmed the text will be amended.

Thanks for comments

Recap: I had "muffled" audio reports. I opened up the rig and adjusted the pot. Still had "muffled" audio reports.

But I kept asking for reports and finally got, I hope, a more accurate report of what the rig sounded like over the air.

What most folks called "muffled" was, apparently, a lack of highs in the audio. In other words the audio was too bassy.

Why?, I dunno ... I'm not an audio expert, but I seem to remember something of a improper value cap across the mike leads affecting tonal quality. Does that make sense to anyone?

Have you opened up the mic at all? I have had some mics where the electret
element was installed backward (open part facing in instead of out) or where
the grill allowing sound into the mic element was obstructed. Both of these
cause the problem you describe, and are much more likely than an internal
electronic component being defective in a new radio. :)

QUADRA SYSTEM (VL-1000) HF/50MHz LINEAR AMPLIFIER
Please check the following link to see all the specs and pictures of this amp.
http://www.yaesu.com/amateur/quadtx.html

I got the Quadra (VCL-1000) from AES in December, but didn't use it until my tower went up on March 7, so it's got about two months of light use. The serial number is: 2G410009. I paid $3999.00 for it. It is in the same condition it was when I opened the cartons, but the dull black finish might have some dust on it. I'll dust it before I pack it. Both units will have all packing, cables, manuals, warranty card.

The amplifier performs as specified or better. I am selling it because I operate break-in CW 90% of the time and would prefer an amplifier with vacuum relay or pin diode switching.

Asking $3500.00 shipped

Same antenna, and feedline for CW and SSB with BOTH rigs?

Are the frequencies the same? Probably not, so if the antenna represents
a matched load on the CW frequencies there must be a higher feedline SWR
on the SSB ones.

I can use the internal tuner to match the rig to the feedline and my
TS570 will happily pump out 100W, but a short distance down the line the
impedance will be different on different frequencies and sometimes the
SWR/power meter will read different values.

However, if I use a remote tuner at the antenna then both meters read the same.

As an extreme example I just tried - the internal turner will match to the feedline on 30 meters with a 40 meter Vee. The meter in the TS570 reads SWR 1.1:1 and Power 100 Watts. About 3 feet down the feedline the SWR and Power are totally off scale.

Just as Dayton started, we finally got proof that the
rumored new VX-2R from Yaesu was no longer
a rumor.

When, 9 weeks ago, I first heard about this cute
little HT, I decided it was time to start a Yahoo
egroup. You need to give some lead time so that
the search engines recognise the new addition.
I wanted it to be ready for the post Dayton mini
flood of new owners.

Here is a link to the group's home page:

Hi

I have a Yaesu FT-one with a locked up VFO. As soon as i switch her on the read out is all 0.000.00's i can spin the VFO till my fingernail turns blue and falls off, but nothing ! I can try to use the keypad to enter a frequency but it's locked up to!

Before it locked up i had just hooked up a new antenna (home made) and yes it
had a high S.W.R So is it the CPU ?? and how can i reset it if it is?? Or is it something more??? (please no)

I was going to enter the VK/ Trans-Tasman Contest with her.

4944. HELP: Yaesu FT-890AT intermittent TX

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-21 12:11:46 UTC
From: "Jose V. Gavila" <eb5agv@ctv.es>
Message-ID: <3ECB6D02.586B6E4E@ctv.es>
Source record: 30076

Hello!

I have got an FT-890AT with some problems. First, power supply connector was intermittent. Then RAM battery (a classic 3V CR-2032 Li battery) was a 'bit' down at 0.07V (I had never seen a CR-2032 battery so low!). But there is still a problem with it. If you put it in TX, at some power levels (with a properly dummy load connected, of course), it quits transmitting. Curiously, it does not return to RX ('busy' LED is off and there is not speaker output). I have found that, in AM, if I set TX output to about 15W and then press MOX button, transceiver goes into TX and power rises up to about 12W. Then it quits but rearms itself after a while and go to TX again and then quits. And so on. If I increase output level, TX to no-TX switching is faster until a point where it gets out of TX and stays there.

It seems to me as if the microcontroler receives some wrong input which triggers it out of TX to protect the rig. But it is not consistent, as sometimes you can get full output (so it seems PA is fine). SWR measures also right.

I have only the schematics, no service manual (BTW, a copy of the transmitter description would be very nice!)

Thanks for your help!

Regards,

JOSE

Just goes to show, you can't please everybody. Sometimes it appears that some people just seem to go places "hoping" to have a bad time so that they can complain about it afterwards. I think the new ICOM was more like $7-8K projected price.

I bet they don't complain about paying $2+/gallon for aviation fuel, $$$ for the airplane motor(s) rebuild fund, etc., though (I'm a pilot, too.) Compare "hobby" flying prices to ham radio prices. No comparison. But what's it worth to you????

Kantronics KPC-3 Packet Radio TNC.....$100 plus shipping

This unit has version 5.1 firmware. The unit works great and is in
excellent condition. Includes the manuals and a copy
of the software disc. If you are a Mac user, I can help you with
Macintosh software. Does not include cables or the wall
wart power supply. This will also run off of a 9 volt battery if you
want to use it with a laptop and run portable packet
radio.

Adrian,

I would take the covers off and looksee around. Also try reseating the
boards. It just might be a connection problem. The FT-1 is about15
years old now I think.

Good luck

Is the watt meter true "peak reading" ? Is the compressor/speech
processor turned on with the 840, but maybe not the 570? Without
seeing it, offhand I'd say it's probably ok, but bears a little
further checking maybe. It's possible the 570 is reading about normal,
but the 840 is being overdriven. But this would depend on the quality
of the watt meter, and the peak reading circuit. If the meter is an
"average" reading meter, with no peak reading circuit, it's normal to
only see appx 1/3 to 1/2 your CW output on phone with normal speech.
Usually about 1/3 with normal unprocessed audio. But of course, a
whistle held long enough would show close to full power. Could be as
simple as a difference in mike levels and processing. Overall, if it's
putting out 100w on CW, you know the finals are ok. I wouldn't worry
too much. I bet the difference "on the air" in signal strength is very
small. All my radios vary to some degree on the amount of drive the
mike circuit provides. Maybe the mike gain on the 570 is a tad low, or
the 840 a tad too high....Processor level differences? MK

I didn't have any real problems with the yamaha, and for some things
such as midi, etc, it's better. But they emulate DOS mode, and won't
run stuff like my DOS SB-FFT DSP program, among many others. SB cards
, or at least all the old "standards" run true DOS mode, if you need
it. MK

Hi,

No you misinterpreted what I wrote. The Power-meter, built-in in the TS570W displays well 100 W when emitting but.... using an external watt-meter, much more accurate made by kenwood too, the REAL power emitted is NOT 100W as read on the bult-in meter, but rather 60 W... here is the problem !

Try to use an external power-meter and take a measurement. It seems tehere are some differences...

Hi,
We will check tonigh this "problem" as I do not know exactly all conditions
of traffic of my friend. There are probably the same but I 'm going to ask
him to make new tests on both rigs.
But Al is not a novice OM and I suspect his observation to be correct.
To be follow.

If someopne can do similar tests using an external watt/power-meter, I
should be glad to get your results.

There is an explanation:
An OM from FP told me that most TX display the same "problem" in SSB due to a factory setting of ALC that blocks some power in TX. A turn of screwdrive to the right can solve the "problem".
On IC 706 i.e., this setting is easy to make screwdriving the internal power button (this is even shown in the manual).
On the contrary this setting is not described in the TS570 manual, maybe on the web.
Goof to know...

> Do you know that problem specific to SSB ?
> and how to solve it ?

First of all, make sure you are comparing apples to apples. Put both rigs on a good dummy load and use an accurate external power meter (BIRD !!) to measure the output of both rigs at the same frequency. Then you will have a clear indication of where the fault is. Quite possibly the ALC on the 570 is turned too low. Simple adjustment takes care of that.

4958. Re: Datong FL-1 filter

Newsgroup: rec.radio.amateur.equipment

From: K3HVG <jeepp@erols.com>
Message-ID: <3ECBCD79.C70DEC9@erols.com>
Source record: 30090

The Datong book is a joke!! Its all of 4 pages, with zero schematic data. I was told by their Rep (years ago..) that they didn't want anyone duplicating the design!!! But, in answer to your question, here's the dope:

Pins 3/5 are the input, Pins 1/4 are the output, Pin 2 is ground (com). I assume you've figured out the other 2 plugs, power and speaker; the outer pins are speaker gnd and the "blade" is spkr hot. Power is + 6.5 to 16v DC to the outer pins and the "blade" is ground -. Hope that helps.

Mine lasted for about 15 years before burning up. Never figured out why... smoke started coming out of it, one day.... 73 de K3HVG

My FT-990's VFD display suddenly went very dim.
Displayed data is still ok but no brightness.
What VFD failure modes are most common?
Any chances it's not the display itself but one
of the voltages driving it? TIA for any hints.

First thought: does the FT-990 have a display-brightness preferences
setting which might have gone wonky? I'd check for that, before
investigating actual physical failures.

If the VFD tube itself has started to leak, it'd go dim, and (fairly
quickly I expect) it'd fail completely.

Dimness which doesn't get worse from time could result from a loss of
drive current to the filament (it's typically a couple of volts, AC,
balanced with respect to ground), or a decrease in the anode voltage,
or wrong voltages being fed to the control grids.

The voltages in question vary quite a bit from one tube type to the
next... you'd need manufacturer's data, or measurements from a working
unit.

Hi all,

I have several RS HTX 202s that I have been collecting over
the years and now want to get rid of a few.

Each is perfect, not a scratch and operationally a 10.
Comes with original box, manual, decent battery,
charger etc. Pretty much one of the last real FM
HTs that were made.

$75 includes shipping, I prefer USPS Money Order.

Thanks for reading the post and let me know if anyone wants
pics.

This could turn out to be a huge problem.

Part 15 rules are so impotent as to be useless. Besides, if your HF transmitter interferes with a dozen part 15 compliant devices in the neigborhood, you lose! Regardless of what the FCC says about the matter.

The manufacturers of these noise-makers need to be held accountable.

Agree - check the software first. If thats OK, then go for the filter electrolytic caps on the inverter stage supplying B+ to the display - in most domestic stuff they are underated for the job they have to do, (especially if its a voltage doubler type circuit) they dry out and the rippple rises on the DC rail. If faulty, (preferably check ESR to confirm) replace with higer voltage units, and make sure they are rated at 105 degrees c. Cant tell you where they are in your radio, should not be too hard to find. Also, check for dry joints same area - they typically run the inverter hot and the solder goes faulty. All this assumes you have a circuit and know how to use a soldering iron.

Mike:

��� Gee I thought you couldn't call it "OSHKOSH"
anymore, without paying a copyright fee ($$) to
some Cheese Head Wi., small town mayor.

��� Well this is my Dayton 2003 trip report.

��� I thought the 2003 Dayton Hamvention was just fine.
Yea it rained all day Saturday (but it wasn't a torrential
down pour), but Thursday, Friday and Sunday where
great days for walking around outside, (and it was warm
enough (in the 60's) during Saturday's all day shower,
that with just a cheap rain poncho, and a umbrella, you
could get around ok.

��� I agree (like the last few years) their where more
BAD deals than great ones; each year the Good deals
are getting harder and harder to find.� But that's NOT
Dayton's fault, I think it's more a global state of the
economy thing.� With BRAND NEW loaded rigs selling
for under a thousand, sometimes at special discounted prices
even as low as $500 (with the exception of Icom's new
IC-8500 of course, what are they thinking (??)), it makes it
near impossible to get a decent buck for your old used rigs.
Should have stayed around till Sunday, I bet that TS-520S
sold in the $300 range.

��� I didn't buy anything on Thursday.
Friday afternoon we found these great deals:
1) Decibel Products VHF cavity (the one that looks like a small garbage
can with black round tuning knobs on top.� $15.00.
2) UHF 4 Cavity Band Pass tunable filters P/N 0183646X12,� I bought 4
of them, I know these are worth 20 times more than what I paid, at $5.00 each.

3) UHF 8 Cavity Duplexer P/N 0183644X03 $25.00
4) 3.0 - 30 Mhz. Used aluminum motorized Screw Driver Antenna $100.00
5) 2100 Ma hour NmHi Batteries (I get a kick how they keep going up a few
hundred Ma each year.� In 10 years they'll be up to 10 AMPS) $1.67 each.
I bought 12 of them.
6) Misc connectors, N to N jumpers and my favorite snap on RF chokes� $10.00.
On Rainy Saturday, we made our major purchase:
1) A HP-8752C Network Analyzer.� Been looking to get one of these babies
for the past 5 years, and been waiting for its price to drop from $27,000 to

less than $5000.&#65533; Well it did this year.&#65533; Paid only $3500.
On Sunday I bought all my new stuff from my favorite Hamvention radio dealer,
AES&#65533; (NO SALES TAX, FREE Shipping, NO radio Minimums & THE BEST
DAMN HAMVENTION $$ on new equipment):
1) Yaesu FT-857&#65533;&#65533; BRAND NEW $739
2) Yaesu FT-897&#65533;&#65533; BRAND NEW $829
3) Icom IC-2720H BRAND NEW $309
Since none of the BIG 3 radio dealers (AES, R&L, HRO) had their ROCK
BOTTOM PRICES posted up this year, I wasn't able to copy them all
down.&#65533; So as an example, (since I didn't buy one this year) I'm clueless
as to what they sold ICOM IC-706MKIIG's for.&#65533; The only discounted
Dayton Hamvention prices I can swear to, are for the three popular rigs
listed above.&#65533; It breaks down to an ~20% savings thou, just like the last
few years.

&#65533;&#65533;&#65533;&#65533;&#65533;&#65533;&#65533; And of course we sold stuff at booths 3256.5 & 3257 all three days,
so I did make a small fraction of the money I spent, back

&#65533;&#65533;&#65533; Over all I have to say it was one of the most quickest (time just flew
by from Thursday to Sunday),&#65533; and it will go down as my most memorable
(that's another story for another time).&#65533; I'm wondering now if next years
Hamvention rules are going to be amended to include FORBIDDING
Cameras, and any type of photography from being taken within the
hamvention grounds (like I said another story).

&#65533;&#65533;&#65533; Of course rumor has it, this may be the LAST DAYTON hamvention.
Next year their talking about moving it to Columbus.&#65533; Personally I think
a much better choice would be holding it in Chicago, Il.

Well this is my Dayton 2003 trip report.

��� I thought the 2003 Dayton Hamvention was just fine.
Yea it rained all day Saturday (but it wasn't a torrential
down pour), but Thursday, Friday and Sunday where
great days for walking around outside, (and it was warm
enough (in the 60's) during Saturday's all day shower,
that with just a cheap rain poncho, and a umbrella, you
could get around ok.

��� I agree (like the last few years) their where more
BAD deals than great ones; each year the Good deals
are getting harder and harder to find.� But that's NOT
Dayton's fault, I think it's more a global state of the
economy thing.� With BRAND NEW loaded rigs selling
for under a thousand, and sometimes at special discounted
prices even as low as $500, it makes it near impossible to
get a decent buck for your old used rigs.� Historically outdoor
flea market selling prices hit ROCK BOTTOM on Sunday.

��� I didn't buy anything on Thursday.
Friday afternoon we found these great deals:
1) Decibel Products VHF cavity (the one that looks like a small garbage
can with black round tuning knobs on top.� $15.00.
2) UHF 4 Cavity Band Pass tunable filters P/N 0183646X12,� I bought 4
of them, I know these are worth 20 times more than what I paid, at $5.00 each.
3) UHF 8 Cavity Duplexer P/N 0183644X03 $25.00
4) 3.0 - 30 Mhz. Used aluminum motorized Screw Driver Antenna $100.00
5) 2100 Ma hour NmHi Batteries (I get a kick how they keep going up a few
hundred Ma each year.� In 10 years they'll be up to 10 AMPS) $1.67 each.
I bought 12 of them.
6) Misc connectors, N to N jumpers and my favorite snap on RF chokes� $10.00.
On Rainy Saturday, we made our major purchase:
1) A HP-8752C Network Analyzer.� Been looking to get one of these babies
for the past 5 years, and been waiting for its price to drop from $27,000 to
less than $5000.� Well it did this year.� Paid only $3500.
On Sunday I bought all my new stuff from my favorite Hamvention radio dealer,
AES� (NO SALES TAX, FREE Shipping, NO radio Minimums & THE BEST
DAMN HAMVENTION $$ on new equipment):
1) Yaesu FT-857�� BRAND NEW $739
2) Yaesu FT-897�� BRAND NEW $829
3) Icom IC-2720H BRAND NEW $309
Since none of the BIG 3 radio dealers (AES, R&L, HRO) had their ROCK

BOTTOM PRICES posted up this year, I wasn't able to copy them all down. So as an example, (since I didn't buy one this year) I'm clue less as to what they sold ICOM IC-706MKIIG's for. The only discounted Dayton Hamvention prices I can swear to, are for the three popular rigs listed above. It breaks down to an ~20% savings thou, just like the last few years.

       And of course we sold stuff at booths 3256.5 & 3257 all three days, so I did make a small fraction of the money I spent, back. Thanks to everyone that stopped on by, and especially to those that left some GREEN Paper ($.$$).

   Over all I have to say it was one of the most quickest (time just flew by from Thursday to Sunday), and it will go down as my most memorable (that's another story for another time). I'm wondering now if next years Hamvention rules are going to be amended to include FORBIDDING Cameras, and any type of photography from being taken within the hamvention grounds (like I said another story).

   Of course rumor has it, this may be the LAST DAYTON hamvention. Next year their talking about moving it to Columbus. Personally I think a much better choice would be holding it in Chicago, Il.

You haven't really clarified whether the external power meter is
reading "peak envelope power" or PEP power, which is appropriate for
SSB readings. If it is not a PEP-reading meter, SSB will read much
lower, compared to CW readings.

A dedicated three-element beam on a 100 foot tower.

>
> Newbie, testing soon and bought
> kit to get into hobby cheaply.

Oh, cheaply! You should have said so earlier!

I'd guess, on the cheap end of things, in this order:

1. Dipole cut to the Rock-Mite's frequency. You wouldn't even need a tuner with this setup because the Rock-Mite only has two frequencies about a kHz apart. Depending on resources, this would be maybe $10 using new stuff.

2. Random wire with tuner. Again, a little more money because a new tuner will cost about $75 and a used one..? However, you will use a tuner a lot as you progress in ham radio.

3. Mobile/whip antenna of some sort. There is a photo of a geek, er, ham operating a Rock-Mite at a restaurant table with a Miracle-Whip portable antenna on the Small Wonder website (www.smallwonderlabs.com). Worked for him...maybe on 20, though...

4. A Carolina Windom 40. A very efficient antenna that QRPers have had success with. I have the Carolina Windom 80 Special and am happy with it. (www.radioworks.com)

5. A dedicated three-element beam on a 100 foot tower. Boy, howdy! We're havin' fun now! Maybe $5K?

The thing looks decent. I have no experience with that manufacturer,
but that means nothing.

The unit is set up for 240 v mains, but since you're apparently in the
UK, that would be desirable.

I think it does not have a storage display, based on the front panel
controls. Storage is highly desirable for slower scan rates. This
has rates as slow as 5 seconds per division, and you certainly can't
use anything nearly that slow without storage of some sort.

All in all, it looks like a decent unit. The front panel controls all
look reasonable, and the auto settings are nice. Certainly not a lot
of money, but no telling how much it will actually sell for.

Best of luck.

Dan's Small Parts seems to have the essentials for building a QRP
tuner in a kit costing under $20. A simpler one could probably be
built out of junk-box parts for rather less.

The minimum would seem to be one variable capacitor of a few hundred
pF, one tappable coil, and some switching arrangements (wires and
alligator clips would do) and a couple of BNC jacks.

I absolutely agree... on this side of the pond.

But the OP is in the UK. Maybe different stuff there.

Negative. NEGATIVE! I found the same article but if you look at the date (see
below) it's a desription for the TS-2000. Sorry but thanks for the effort.

I will look at this from the buyers standpoint. I pretty much don't even bother to go to hamfests of any kind unless it is for the intention of just social interaction. Too many hams selling think the crap that is ten years old should still command a brand new price! Every item sold incurrs some amount of depreciation until it reaches a point of collectivity, rarity or "antique-ness."

Don't know if they can regulate photography, can they??? I wonder if that is legal? Maybe inside of the arena, but on the grounds might prove to be a little different. I can see it now.... the Camera Cops!

Loosen the two screws that hold the PTT button assembly to the case, no need to remove them entirely. loosen the battery slide plate screws, if you elect to remove the plate and battery latch observe how it was installed so you can reassemble it. The may be another screw on the radio front panel to remove.

Now gently lift the bottom of the front panel and GENTLY pull it down to clear the case top. Only about 1/16 inch clearance here is all that is needed. BE VERY careful as there is a ribbon cable that attaches the front panel to the rest of the radio. The inner chassis can cut that cable. Remove the front panel, it will lay nicely to the right of the main unit.The front panel can be left connected to the ribbon cable.

Unplug the existing tone encoder, remove the backing from the double stick tape on the UT-40, plug it into the IC-32AT and reinstall the front panel.

You might want to do a cpu reset to make sure any static charges are cleared out of the cpu, otherwise it should work just fine.

5003. What linear for HF ?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-23 20:47:10 UTC
From: Thierry <lombrytNOSPAM@hotmail.com>
Message-ID: <3ece88cf$1_2@news.vo.lu>
Source record: 30034

Hi,

In a few month I 'ld like to buy a HF linear. My specs are : class C of course, as light and small as possible (utopic ?), not source of QRM over 3 kHz each side of QRG, fan generating low noise, not too hot at full power, to connect of 220V, long life...
The antenna will probably be a vertical supporting 1.5 to 2 kW (as I am not sure than a G5RV #14 wire should support such power).

My objective in a first time is to drive a TS570D and later maybe a high-end (TS2000) using the linear at a maximum of 50-70% of its nominal power; never more.
i.e. I would like to use in some specific conditions of traffic (night DXing or in condition of low propag , etc) 1 kW, so the linear should able to emit up to 1.5 or 2 kW max. (I prefer to keep some power left in order to not use the PA at the maximum of its power all the time, to preserve its longevity).

What quality brands and models support such specs and what could be the price range (preferably in Europe) ? I have no idea at all of performances offered by this kind of material, their weakness, specs to check closely, etc.
Some URL and brands should be welcome.

Thanks for advices.

> k5qwg

Also some peak readers are passive and some are active. The passive meters using "caps", usually drag behind and end up reading low on normally driven speech. On a meter like this, mike drive and any compression differences could cause a fairly large difference on a meter. I've got a MFJ tuner here with a "pseudo peak reading " meter using caps. It still reads way low on SSB. I can do 100w CW on my 706mk2, and see only 35w or so SSB with the meter on "peak reading". I can switch to my TS-830 using a bit of RF compression and see maybe 40-45 watts.
But both are doing 100w CW. The "supposed" peak reading meter is fairly useless regardless of what it says on the front panel. Sure, I could pump up the mike gain, and read more, but then I'm overdriving. Offhand, I still think the radio is probably ok, it's just a low mike drive issue, differences in compression, the other radio is overdriven a bit, or something along those lines. Some radios do have "low power" switches inside, but that should also effect CW if that were the case. If you have a 100w radio and check SSB on an "average" meter, with no peak reading, you should not see peaks over about 1/3 of actual power, unless you are overdriving. If I didn't see peaks of at least 25-30-35 watts on an AVERAGE meter, then I'd be starting to worry. MK

> Goof to know...

The only thing is, if you turn down the ALC, the CW output will drop
also. I doubt that is the problem if he's doing 100w CW. Could be low
mike gain though. I wonder if the mike is "factory" or homebrew...If
it's factory, most are set up to be able to run the radio at about the
halfway point as far as mike drive. Of course, a different homebrew
element could be too weak. I have to run a mike preamp on both my
icoms using my audio technica dynamic mike. MK

From: terabyte@sprintmail.com
Message-ID: <3ecee311.1625733@news.earthlink.net>
Source record: 30042

Just a suggestion, see if you can borrow an MFJ 259 analyizer from a friend. You can easily ajust your tuner for the correct settings on each band. Just remember to adjust the lowest SWR with the least amount of reactance and mostly resistance. Your rig will easily handle resistances in the range of 50 to 75 ohms.

5012. ICOM T90 Power at 477MHz ?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-24 04:09:50 UTC
From: chris@nowhere.com
Message-ID: <chris-1802F6.14095024052003@news-vip.optusnet.com.au>
Source record: 30044

Could someone test the power of a mod'd T90 at 477 (and 440 for a reference point) please ?

Mods.dk doesn't really indicate what power to expect. Various posts suggest between about 1.5 and 4.5 Watts. I'd dearly love to know.

thanks,
chris

Thierry wrote:

> In a few month I 'ld like to buy a HF linear. My specs are : class C of
> course,

There's no such thing as a commercially available ham class C amp for HF. Why would you need that, anyway? They're all class AB so that they can run SSB.

> as light and small as possible (utopic ?),

The higher the power, the heavier the amp. There are no magic amps out there, but there is at least one manufacturer offering solid-state amps (hint: switcher power supply), as well as a new company that makes switcher HV power supplies only.

> not source of QRM over 3
> kHz each side of QRG,

Irrelevant. If an amp meets the specs (and it has in order to be certified for sale), then it won't affect the driving signal one bit. Provided you don't overdrive it, of course.

> fan generating low noise,

Again, more power = noisier fan, generally speaking.

> not too hot at full power,

Then you need to consider 100% duty cycle (brick-on-key) amps.

> to connect of 220V,

Almost all do.

> long life...

Life depends on the tubes, how they're driven and what the filament voltage is.

> The antenna will probably be a vertical supporting 1.5 to 2 kW (as I am not
> sure than a G5RV #14 wire should support such power).

Does not make a difference. Your wire will take all the power you can give it.

> My objective in a first time is to drive a TS570D and later maybe a high-end
> (TS2000) using the linear at a maximum of 50-70% of its nominal power; never
> more.

Won't make one bit of a difference for a properly designed amp.

> i.e. I would like to use in some specific conditions of traffic (night DXing
> or in condition of low propag , etc) 1 kW, so the linear should able to emit
> up to 1.5 or 2 kW max. (I prefer to keep some power left in order to not use
> the PA at the maximum of its power all the time, to preserve its longevity).

Again, makes a little difference if driven properly. As in all other cases, output power is proportional to price.

> What quality brands and models support such specs and what could be the
> price range (preferably in Europe) ?

No one can do your homework for you. You list some pretty vague and generalized requirements that pretty much all the amps in the market meet. Get on the Internet and look for manufacturers. Here are two links:

http://www.ac6v.com/radiodealers.htm
http://www.qsl.net/w5www/hamads.htm

If I were in the amp market today, I'd consider an Alpha, Command Technologies or QRO Technologies, but I have different requirements from you.

Some other aspects I would pay attention to: full QSK capability (if you work CW), automatic tuning (if you have too much money) and spare tube cost (3-500Z tubes are dirt cheap).

while class c is an amp class, it is not called linear, because it doesnt amplify a band linearly, ie the bandwidth of ssb signal. class a and class ab do a more linear job and thus 'linear'amp. I suspect that class ab is what you want.
look at Ameritron,Qro, Alpha, Commander, Henry, and if you have a lot of american dollars, you could consider Acom.

Hi,

Ok for these considerations.
Some of you well understood my problem. My specs are quite vague because I do not know yet very well this subject (linear).
We all know that in period of bad propag. only CW signal can still reach their "recipient". Therefore I speak about class C P.A. and I forget the fact that its non-linearity can affect SSB (I knewn but didn't think it was VERY important). But for me a linear will be less useful when propag is good (where I do not really need a linear). But you right.

Thus for short, I really need a class AB model. OK Zoran for your hardware considerations. This is what I have suspected (weight, warming, noise, lifetime, 220V, etc).

I know Ameritron by name but no more, and all others are unknow from me. That means that its reputation has already reached me. I will check on the sites you have suggested.

Thanks
Thierry

5016. Drake TR-5 transmit delay in SSB

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-24 09:41:31 UTC
From: k1mr@optonline.net
Message-ID: <47f14440.0305240141.792e10e1@posting.google.com>

Two questions:

1. Have you checked the T/R relay, perhaps the contacts are somewhat corroded or slow to finalize.

2. Have you checked for parasitics? On a TR5 of mine, I saw some really nasty stuff on 40m, which lasted only a second or two after keying, then went away.

Good luck;

It's hard to recommend anything, not knowing what brand names are sold
in your part of the world, or whether you're willing to import a very
heavy piece of equipment from the U.S. Shipping can be pretty
expensive across the Atlantic, unless you ship "surface" which can
take three or four months. What brands are advertised in some of your
European radio magazines?

You can always try the web sites for:

Alpha Power
Ameritron
Command Technologies
QRO
Henry

Many of them sell "export" models which are far more powerful than
anything we American hams can buy.

Hi,
No Problem Bob. Of course the best for me should be to buy something locally
to avoid exceeding charges and maintenance problems.
But I really need help and advices as not many OM use linears.
I will soon visit LX9UN radioclub, and I will discuss about all that with
them.

Thanks for advices.

Thierry

Hi

I have an coax antenna switch for 2 antennas. However I have two HF tranceivers and only one antenna.

Can you reverse the use of the switch (attaching two transmitters and one antenna) with out damaging one of the tranceivers when transmitting on the other?

Yes.

Just don't key the wrong transceiver or you could blow the finals.

Yes, I almost always use my Delta-2 or Delta-4 in that fashion. I use my antenna tuner to switch between antennas and coax switch's to switch between rigs.

5036. FS: sma-to-bnc custom fit antenna adapter

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-25 18:19:23 UTC
From: gulyas@earthlink.net
Message-ID: <12235960.0305251019.2bb55935@posting.google.com>
Source record: 29968
Cross-posted to: rec.radio.swap,rec.radio.scanner,rec.radio.amateur.equipment,rec.radio.amateur.misc

Do you have a need for a high-quality SMA-to-BNC antenna adapter that
is custom made to fit and protect your H.T. or scanner radio?

Adapter allows you to:
Quickly change antennas to base, mobile or different style use.
Use the more popular and wider selection available of BNC antennas.
Prevent chassis connector wear or from coming loose due to antenna
changes.

Adapter features:
Gold plated contacts with a teflon insulator.
A low profile design with a rubber covering for a factory antenna look.
The rubber base seals to the top of the radio with no spacers needed
for moisture and dirt protection.
The base also provides an excellent support for any length of antenna
or application.
No need to remove adapter once installed to make a quick and safe
antenna change.

Sizes to fit radio models:
Yaesu: VX-5R, VX-7R, VX-1R, FT-50-R, VX-10, VX-150, VX-110,
VXA-100, VXA-120
Icom: IC-T90A, IC-T8A, IC-T81A, IC-Q7A, IC-R2, IC-R5
Kenwood: TH-D7, TH-G71, TH-F6A, TH-F7A
Alinco: DJ-V5, DJ-X3, DJ-S40
Standard: C508A, C510A
Radio Shack: HTX-420, HTX-400, HTX-245, HTX-200
Aor: AR-16

Previewed in the May 2000 Issue of CQ Magazine, and the Nov. 2000
Issue of QST Magazine.

$11.95 + $1.50 S+H(One to unlimited)

5049. Yaesu FT-50 Question - MARS Mod

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-25 20:25:34 UTC
From: WB8ICT <WB8ICT@NOSPAM.arrl.net>
Message-ID: <2F9Aa.13742$IK4.8666@nwrddc03.gnilink.net>
Source record: 29981

I just bought a new FT-50 at Dayton and wondered if the
MARS / CAP mod still works on the newer units. I have
an older FT-50 that I mod'ed years ago and wanted to do the
same to the new one but didn't know if they had changed
the newer radios to prevent this. Can anyone help?

TIA,

Tom WB8ICT

Collins 51S-1 Round Emblem Receiver This is a General coverage receiver and looks like it was nicely kept. The front panel is WONDERFUL, Looks well preserved, No scratches No dents, Nothing!! Just looks GREAT!!!! Doesn't look like any one ever touched it up, looks original. I was told that the person who had it didn't do any mods or put extra holes in it or anything else. Serial # 7210 I put it on a wire and heard station coming in GREAT! I even listen to AM staions and it sounded great! The cabinet looks pretty good, No dents, and where you lift up lid on cabinet a little paint is worn.. I wouldn't even bother to paint it, Because the rest looks fine. Comes with power cord, No manual.

Source record: 29986

Offered is a high quality antenna tuner made by Tokyo Hy-Power company famous for their excellent linear amplifiers.

This tuner is in very good condition with only a few marks from years of faithful use. Tuning is very quick and virtually effortless. Power settings are 20W and 200W making it a great choice for QRP or QRO operation.

The tuner will tune coax or random lines and it's small enough for field use and large enough for you shack.

Tuner is housed in a rugged metal cabinet.

I will ship to lower 48 and Canada for $125USD.

Hi all,
I 'm trying to repair an 8482A. I've removed the sensor assy and am trying to slide the substrate out of the cylinder, however it is held in place by 4 pins. These don't appear to be a hex key or other tamper proof tool, they appear to be press fit.

Any one provide some hints on getting these out so I can remove the substrate?

Thanks in advance

Do you use it with the remote head? If so, is it a custom remote kit or can you use readily available parts not specifically made for it?

Yes, you can, provided not more than 100W (+50dBm) each at any one time.
The isolation at 30MHZ (worst case) is about 70dB. This means the other
rig being on either active RX or passive RX (ie off) will get get -20dBm
(22mV) at its input which is still safe.
At lower frequencies the leakage is even less of a problem.

5063. TM-742 Won't Turn On

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-26 16:55:45 UTC
From: fmmck@aol.com
Message-ID: <20030526125545.07446.00000345@mb-m22.aol.com>
Source record: 29995

When I made a repair to a bad solder connection in the TM-742, it appeared to work OK at first. Then I noticed that I had to press the power button twice before it came on. Later, it stopped working at all. (The repair had been to an area that has nothing to do with power-on circuitry.)

The radio was purchased in about 1994, so perhaps a new battery was in order. After replacing the battery, it again appeared to work. However, as soon as the radio was completely buttoned-up, it no longer would come on when the button was pressed.

Could it be a bad power button? I traded front panels with a TM-942, and it seems to work 100 per cent. However, the TM-742's front panel also works 100 percent with the TM-942. Trading back, the original problem returns. I tried several swaps to be sure.

Does anyone have any hints to what might be going on?

Thanks for any clues to help solve the mystery!

Source record: 29997

I am the original owner of an IC-970H. This is a daul band ALL-MODE
satellite base radio. It does 50 watts on 2 mtrs and 35 watts on 70cm.
Unlike the Yaesu 736R, this radio receives simultanously on two bands and is
a TRUE dual band radio.
This is the cadillac of Satellite radios. It has never left my shack since
I bought it seven years ago. It has extra cavities for
optional plug ins for 50-905 receive, 1.2 transceive all modes, 2.4 all
modes. I Do not have any other modules for it.
I did put one tone decode tone schelch board in on the two meter side.
The radio is emaculate and works perfectly. I have decided to sell to come
up with money for my trip to Europe this summer.
Comes with manual but no microphone. Original Box.

$1200 plus shipping.

The 84XX series of sensors were never designed to be repaired. If they fail, Agilent just charge for replacement. Even if you do get the substrate out, I doubt if you will be able to get the replacement diode for it.

I am sorry to put a downer on you, but I suspect you are wasying your time.

it's in excellent working condition, with a few scratches
on the heat sink. also got a copy of the instructions manual.
had to replace the master power switch several years ago,
(ouch $30). $375 will get it to your door via insured, usps priority mail.

There's some groups I read in their entirety and some I skim. This one
tends to be one I read all of. I don't often read mindspring.test or
EARTHLINK.TEST (or misc.test, or alt.test) unless I've been doing some
testing myself.

You've got a problem -- the A1 unit (thermocouples plus diode) are not
what's considered a user-serviceable item. The service manual gives a
hint at this when it talkes about tweaking performance by varying the
position of the wires from A1 to the interface board.

If you've popped a thermocouple, which is all too damn easy, save the
spare parts and start hunting for another unit. Th.ey turn up on eBay
all the time.

Good luck!

Hello Jose.
I have a service manual for the FT-890AT
I don't have a way of scaning it at this time.
I could copy some of the pages and send them to you. I need your address to
mail the copies to.
Have you checked with Yaesu to see if they have a copy of the service manual?
they have some manuals on line.
Mike, K6STU

Hi Gerry,

A small piece of electricians tape over the hole for the microphone will do the trick. It's just below the speaker grill on the right side.

How are you powering your radio? If from an AC power supply, you may
have a failing power supply. Your display's brightness shouldn't
change at all regardless of your transmit power setting.

Clif--

You are 100% correct.

I took your advice, and looked more closely at the cabling,
and sure enough, I used a power pigtail that appeared to be
the same guage as my other red/black power cables, except
it wasn't...the insulation was just thicker.

Thanks for the heads-up.

This should be enough motivation for me to solder on all of
the Anderson PowerPole connectors I received, and do it
to the kit's heavy guage wire.

Thanks, and 73.

I realize you found the problem, but the answer to your question is:

http://www.therfshop.com/

I also have a DR-570, and Randy fixed my dead display.

Randy does FAST quality work. He had my radio back before
I even missed it.

I wonder if it uses one of those rubber backed buttons, that makes contact with a couple of traces? If so, that could indeed be the culprit. I have a Linn Kudos FM/AM/LW tuner that exhibited this problem with its switches. I dismantled the switch panel, and cleaned the rubber contacts, and the PC board contacts with Caig Pro Gold. The problem hasn't returned.

Pete

I designed and built an assortment of open frame linear power supply boards for electronic projects.

ALL are completely assembled and tested.
Jumper selectable for 120/240V input
Board dimensions 3.8" x 2.5"
Height is 1.25" or less (fits in 1U rackmount chassis)

6.3 Volt / 650 mA / $29 (tube filament supply)
12.6 Volt / 380 mA / $29 (tube filament supply)
15 Volt / 320 mA / $29 (general purpose supply)
18 Volt / 290 mA / $29 (API pre)
24 Volt / 210 mA / $29 (Neve and 990 pre)
48 Volt / 60 mA / $35 (phantom supply)
90 Volt / 36 mA / $35 (Trans-Oceanic radio, etc.)
120 Volt / 28 mA / $35 (Tube B+, great for subminiatures)

Check my website for pictures and complete specifications. Asking prices do not include CA sales tax and shipping. Credit cards OK when paying through PayPal!

INTERESED? Please respond BY EMAIL to <OvrReactor@aol.com>, do not post.

It's called the Channel Guard by CBCI. It provides improved ACR
(Adjacent Channel Rejection) by enhancing the IF filtering of the
radio. I have one installed in my 10-meter rig with rather good
results. It is NOT DSP (Digital Signal Processing) though. Hope that
helps. Here's the link:

Geez...that's only 50 Hz. Why is he worried about it? Tell
him to undue the 10Hz mod and life will be wonderful again :)

I had the reset regulator for the micro go bad in mine. It is part of
the removable head. L78LR05BFA was the generic part number. Kenwood
only sells the whole head as an assembly. I found a parts dealer out
west who stocked them and I replaced it. It requires dissasembly of
the LCD which is dificult to say the least . Good Luck.

There is a procedure in the *User* manual about adjusting the RX freq
readout. It says to use a signal generator, but it sounds like you want
to do it by ear, anyway...

What makes you think your rig is on the money? Freq measurement when
listening to LSB is pretty unscientific. At least have him zero-beat to WWV.

<< Anyone have any serious suggestions on how to
stabilize the VFO in a Johnson Ranger? What
mods have YOU personally done to YOUR Ranger
to improve stability? >>

Dean-

It has been too many years since I had a Ranger! I don't recall the VFO being any more unstable than other similar VFOs. Of course, we are spoiled by the modern synthesized rigs that are locked to a crystal.

I'm not sure about the Ranger, but other rigs of that era used a voltage regulator tube like the VR-150 or VR-105, to stabilize voltage to the VFO. One minor improvement would be to replace it with a stud-mounted Zener Diode of the same voltage rating. I don't have the number, but once found one rated for 105 Volts/10 Watts. I used the "R" version so the stud could be bolted directly to the chassis of a Heathkit HW-100 that used a 105 Volt regulator.

Use of a Zener may not make much improvement, but I believe it provides better regulation than the old VR tubes.

You tune your radio where the other person sounds the best. Just
as WA7AA mentioned, what makes you think that your radio is the
standard?

Being in the service industry, you could take two radios, tune them
by 2 different techs on the same test equipment and they will NOT
be perfectly aligned. They'll be close (like 50 Hz, hi) but they will
never be the same.

If I remember right, to enable the "10 Hz" digit on the display, a
mod
has to be done just like the TS-440. It doesn't really do anything
other
than give you more resolution on the display. I've always hated that
mod, for the reasons you guys are seeing.

I run an ICOM 706. I tune to the other guy and don't really pay
attention
to the last couple digits of the display.

The frequency calibration may not be too important, but for me I like to
have the rigs as close as I can get them. Even with a .5 PPM TCXO the
the radio can still drift around a few hz on 28 Mhz. On 3.5 Mhz it will
be much less, but still some so yes you will most likley never be able
to be exactly on but you can get close.

I typically can calibrate my radios within 10 hz of each other, that is
if they have TCXOs. Most times I can get even closer. My radio to be
calibrated will be on usb or lsb tuned to the highest WWV freq that's
open and a second receiver, anything that will pickup WWV on any freq
will be on AM. I use the modulated side tone and not the carrier. I
adjust the volumes of the two radios to about equal and wait for the
side tone to appear. I think it's 500 or 600 hz. Then adjust for zero
beat of the side tones. Works everytime. I have a Icom 775, TS-870,
TS-950SDX and a TS-2000, all have .5 PPM TCXOs.

Also another factor to keep in mind is that some of the older rigs tune in 10 Hz resolution. The 775, 870, 950SDX and TS2000 tune in 1 Hz. If my memory serves me I think the 850 tunes in 1 Hz which is nice. The old reliable FT1000 tunes in 10 Hz. The 775 is the only one to my knowledge that can actually read out to 1 Hz. Wait a minute I think the Icom Pros can too and maybe the 706.

Just my .02

In reference to the duplexer, AES sells a Comet CF-530C "backwards" duplexer. Does this mean a normal duplexer is to connect one antenna to a radio with multiple ports and this "backwards" duplexer is to connect two antennas to the one antenna port on the FT-8900?

Has anyone used any other brand "backwards" duplexer?

The correct term is diplexer- even though some of the industry geniuses continue calling them duplexers. A diplexer has no way of "knowing" if it is combining or splitting.

Every one listed on AES's website is a "du"plexer... in any case, any idea why they would have a CF-530C and a CF-530, with the "C" being labeled as a "Backwards duplexer"?

Come on people, who is bs-ing who.
I had a kenwood ts-430 in my subaru for 3 years, used it all of the time
and nothing happened to my car.

Did I just get lucky? Maybe.

I use the Ameritron AL-811H (800 watts) amp on a G5RV along with a Titan
DX vertical. The G5RV is still up after 6 months, it didn't melt yet.

5132. SyntorX replacement Flash memory module (code plug replacement)

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-29 22:45:51 UTC
From: Chris <c_sieg@conknet.com>
Message-ID: <3ED68CA2.2F47F2E7@conknet.com>
Source record: 29814
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Hi SyntorX Fans,
We have just completed a design of a replacement memory module (code plug) for the SyntorX radios. Our module is plug compatible with the existing code plug, and allows you to download channel information from your Windows (95, 95 ME, 2000 or XP) compatible computer via its serial interface port. Comes complete with software, serial interface cable and

Flash module. For the full scoop take a look at:

http://www.piexx.com (Then click on the Flas module picture)

Of course, if you like, you should take a look at our full Syntor and SyntorX to PC Syntor Revival upgrades as well. These upgrades allow you to
control your transceiver via a virtual control panel on your PC. No cables
or control heads required.

Thanks,
-Chris

Bert:
Thanks, but this is a speaker with some circuitry inside the case, not a receiver modification. I now learn this one was purchased at a Radio Shack in N. California. The RS in Texas no nothing about such an item. Research continues.

The first post was from memory. I just opened the Instruction Manual and
on page 66 it shows the procedure. It involves a supplied accessory
calibration cable and tuning to WWV.

Fifty Hz is within the specs on stability and readout, btw (10 PPM).

My call? Vanity. Extra? Yes.

I know it is not funny, but such is why I still drive Chevrolets after 35 years! I just finished installing an IC706 in a S-10 and, like always in the past, the HF is quiet, performs as expected, and has no issues with RF. I have had some odd things to happen (such as windshield wipers a-wipin' and lights coming on when they shouldn't, but that was easily cured with a choke. I looked at a RAV4 because I thought they were "cute". I think I'll stay with Chevy.

YUP!! Chevy all the way!!!! Before the days of imports, we used to joke
that we could hear a Ford come by while we were listening to the AM
radio--still happens sometimes. Chevrolets always seemed (or all GM cars
seemed to be) to be "tighter" in the RF department. I could put a
radio in a Ford and the ignition noise would be horrific. Put the same
radio in a GM car--quiet as
a mouse. Seems to still be that way after all those years.

Exactly!! By the time the Toyota driver figured out why his car/truck
knocked off, you would be
long gone in most cases. He *saw* some driver talking on a radio nearby?
Doubt it. Hard to prove what happened. I do know of a guy that enjoyed
blowing out teenagers' in-car boom-boom
stereos with his KW+ linear.

<< Friend has one that is UP .05....how can I/he adjust it down? in other words, when we talk on 7.245, he must go to 7.245.05. >>

Murray-

Many radios, especially those with analog VFOs and digital dials, continue to change frequency as you move the knob, even though the digital readout doesn't change until the next increment is reached. For example, a readout might be set to show the Ten Hz digit, but the oscillator might be changing in One Hz increments. Before you can calibrate the rig against WWV, you must be sure the knob hasn't been advanced beyond the point where the digit has just changed to the WWV frequency.

My approach to comparing frequency with WWV is similar to the one mentioned by Dale, K9VUJ. Use the highest one available at the time, preferably 20 MHz. Set the dial at the point where the digits just change to 20.000.00, listen to the WWV audio tone on AM. Then change to USB, and then LSB. In all three positions, frequency calibration should be adjusted so that the audio tones are the same. This is comparable to Dale's zero-beating the audio tones between two receivers, except you're making the AM, LSB and USB tones equal in the same receiver.

This approach works on Kenwood and Icom rigs where changing the USB and LSB carrier oscillators do not change the frequency of the transmitted or received signals. It doesn't quite work on some rigs such as the Radio Shack HTX-100, since the LSB and USB frequencies are adjusted independently.

Another approach requires an accurate oscillator such as a Rubidium or Cesium oscillator, and an oscilloscope that can display the necessary frequencies. By connecting the accurate oscillator to the oscilloscope's horizontal sync input, you can observe the drift of a signal connected to the vertical input. A sample of your radio's frequency-determining oscillator can be obtained connecting a sampling coil of three or four turns of stiff, insulated wire, formed on a small rod such as a pencil, to a piece of co-ax cable. The accurate oscillator doesn't have to be the same as the radio's oscillator as long as the frequency ratio is fairly simple. For example, Ten Mhz against 24 MHz. When the radio's oscillator is exactly right, the sinusoidal pattern on the oscilloscope will stand still. Knowing the frequencies involved, it should be possible to calculate the error by counting the number of seconds it takes for the pattern to drift one cycle.

I have a HamStick on my new Subaru Forester. When I transmit 100W in parts of the 20m band my windshield wipers operate. I avoid 20m now, but I also know that other bands might be doing something else to the computer, so I never operate while driving.

Have no trouble in my Subaru Legacy, of course I did have to put lots of ferrite beads around to clean it up. Thats whats wrong with most of you guys systems, not clean!! Try exact proper lengths on coax...plenty of grounding...ANY< I SAY any of these foreign cars can be used with 500 watt ham any where, if you just get em RIGHT... If all else fails, cover the computer module and ground it ! 73 Murray

Quite true, I haven't grounded the radio chassis, and I haven't placed ferrite beads anywhere. I did keep my coax as short as possible, though.

Where should the ferrite beads be placed? I'll put a choke on the power and power ground wires close to the radio and get a good chassis RF ground. Are there places in the auto wiring that need some chokes?

Certain mfgr's are BSing owners. I dunno about Subaru but BMW says their warranty only covers defects in materials and workmanship. So if your new BM's computer controlled brakes put you in a ditch because it is susceptable to common RFI then that's a design fault and not covered.

Radio Shack sold a DSP external speaker cat #210-0543. I don't know
when it was discontinued. Probably before they became a bad cell phone
store. The manual is still available online.

Paul, I believe that Robert met his demise some time back. He presented a moving target the last few years around 586 and 686. I've tried to contact him on more than one occasion.

I have 586 and 686, as well as the original which I paid for. He sent the others gratuiously when they became available. If you have a high speed connection, I can zip the files and send them, if you'd like to just give me an address, I can send a floppy.

Regards

W4ZCB

This is not 100% true. I work for a State Forestry Unit here in SC. We have installed a Motorola unit in a Honda, Toyota and just about every brand of american vechicle you can name.

In fact the Toyota dealer looked up a Service Bullentin and helped us ensure we kept power wiring and antenna cable away from any of the computer stuff in the vehicle. They showed us where the power wiring and input cables for the on car computer controls were located for no cost. this on a 2003 toyota.

Verify your facts gentlemen..

Mitch

The way the broadband companies have been talking, I expect they'd be
in a position of having to sell power over "fiber to the curb".
Should be interesting to see them try... until the glare gets to be
excessive. ;-)

That's probably a non-issue these days. The new cars and trucks don't have high voltage distributors like in the old days. Instead of long stretches of 40KV wires from the distributor, there are individual coils at each spark plug and the distributed juice is 12 Volts. That's a _much_ cleaner way to do things - especially as far as RFI is concerned.

I feed my PRO-90 into the MP3 jack on my car stereo. 140 watts, 4 speakers.

5181. Telemetry / remote operation station question...?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-31 16:43:00 UTC
From: achilles03@hotmail.com
Message-ID: <fef44ceb.0305310843.75f52008@posting.google.com>
Source record: 29863

I'm studying for a tech's license for an experiment involving a high altitude balloon. From what I've read, a station can not operate without an operator present, with the exception of repeaters. My question is, does this apply to telemetry also? Do you have to get a special waiver or something?

For example, if I were to transmit CW from a weather balloon, would that be considered in violation of FCC rules? Or if I include my callsign in the transmission every 10 minutes, would that make it legit?

Or is telemetry in a separate catagory altogether?

Thanks in advance for fielding a newbie's question!
Dave

Do you have BPL in GB? If you do whats it like? Can you hear it on
your SW radio? I'm trying to learn more about it. I'm still unsure how
this will affect HF, but everything I've read has been very negative.

try taking the radio aort and cleaning it with a good blow from an air hose
or a can ogf that stuff for computer key boards i think its a dust problem
or a coorode contact in the potentiometer..try it and see if that works
or use some contact cleaner on the poteniometer and clean the contacts good
and im sure this is your problem cuz electronics hate dust as much as us
folks doo:0

Just gave it a look. My GAWD....so much for HF. Can't wait till the
sunspots peak out and we have this crap worldwide. Maybe we can use it as a

beacon.

One thing about it tho. We can trash them just as well and they can trash us.

Dan/W4NTI
